STEFANSSON (*stĕf'ăn-sŏn*), **VILHJALMUR** (1879–). Was born in Manitoba, educated at the State Universities of North Dakota and Iowa, and at the Harvard Divinity and Graduate Schools. Leader of several expeditions into the frozen north—to Iceland, 1904; to mouth of the Mackenzie River and Northern Alaska, 1906–7, to the Arctic, 1908–12; to Banks Island, 1914; to Prince Patrick Island and to land he discovered, 1915 and again in 1916. Stefansson interviewed several tribes of Eskimos who claimed they never had seen a white man. He has written scientific papers, a number of books on the Arctic regions, including *My Life with the Eskimo*, *The Friendly Arctic*, *Hunters of the Great North*, and has lectured frequently before clubs and popular audiences.

STEINMETZ (*stīn'mĕtz*), **CHARLES PROTEUS** (1865–1923). An electrical expert and inventor, who for many years was connected with the General Electric Company at Schenectady, N. Y., and with Union College as professor of physics. Many problems were worked out under his direction, the results being published in valuable monographs and books.

STILL, ANDREW TAYLOR (1828–1917). An American who was successively farmer, soldier in the Civil War, country doctor, prospector, and discoverer of the principles of osteopathy. For many years he closely studied human anatomy, but the death of four children in 1864 of cerebro-spinal meningitis turned his attention to the spinal cord as the center of osteopathy, or adjustments of bones and other parts of the body which cause disease.

SWEDENBORG, EMANUEL. See under DICTIONARY OF PHILOSOPHERS.

THENARD, LOUIS JACQUES, BARON (1777–1857). French chemist; made the discovery of the peroxid and the persulphid of hydrogen, of boron, hydrofluoric acid, and fluorid of boron.

THOREAU. See DICTIONARY OF AUTHORS.

TORRICELLI (*tŏr-rī-chĕl'lī*), **EVANGELISTA** (1608–1647). An Italian physicist, pupil of Galileo; invented the barometer; improved the telescope; and was the first to construct a simple microscope.

TROWBRIDGE, JOHN (1843–1923). An American professor at Harvard (1866–1923), who introduced laboratory work in physics, and did much to spread information as to electricity and X-rays. Among his efforts to make scientific study popular were the books entitled *The New Physics*, *Three Boys on an Electrical Boat*, *Philip's Experiments in Electrical Science*.

TYNDALL, JOHN (1820–1893). English physicist, who by his lectures did much to popularize science. His treatises on light and sound, and on radiant heat and its action on gases, are the result of his original researches; his work on the motion of glaciers was published in conjunction with Huxley.

VANCOUVER (*văn-kō'vĕr*), **GEORGE** (*c.* 1758–1798). An English navigator and explorer who mapped much of the coast of what is now the United States from San Francisco to Vancouver Island, Canada, which he circumnavigated (1790–94). He had sailed with Cook on the second and third voyages, went from England around Good Hope to Australia, part of the west coast of which he surveyed (1791), visited the Hawaiian Islands, and on the return he observed the southern point of California, the Galapagos Islands, and others.

VAN'T HOFF, JACOBUS HENRICUS (1852–1911). Dutch physical chemist, who taught at Amsterdam (1878–1896), and then in Germany. In 1901 he was awarded the Nobel prize for chemistry. Among his fruitful researches were those in valencies of carbon atoms, from which he developed the knowledge of asymmetric carbon, applied dynamics to chemistry, made a new theory of chemical affinity, and explained ocean salt deposits.

VAUQUELIN, LOUIS NICOLAS (1763–1829). A French chemist, who discovered two elements, beryllium (1798) and chromium (1797), and several compounds like camphoric acid and asparagine. From 1783 to 1791 he worked in the laboratory of Fourcroy, with whom he published some researches, and from 1809 to his death he was professor of the Medical Faculty of Paris. Nearly 400 chemical articles were from his pen.

VERRAZZANO (*vĕr-rät-sä'nō*), **GIOVANNI DA** (*c.* 1480–1527). An Italian navigator of Florence, who (1524) explored the waters of the American coast from Cape Fear as far north as New Hampshire.

VESPUCCI (*vĕs-pōōt'chē*), **AMERIGO** (1451–1512). A sailor and merchant of Florence, Italy, whose name was given to the new world as *America*. According to his own statements, some of which seem improbable, he made four voyages to western waters, one of which would have brought him upon the north Pacific coasts, one to San Domingo, one to the southern arctic waters, and one to the eastern coast. Some doubt this last voyage (1497). If Vespucci's accounts are correct, he saw the coast of America eight days before John Cabot did. His later days were spent as chief pilot in the service of Spain.

VOLTA, ALESSANDRO, COMTE (1745–1827). An eminent Italian physicist; inventor of the voltaic pile, the first electric cell or battery, the electrophorus, the condensing electroscope, the electrometer, the hydrogen lamp, and the electric pistol.

VORONOFF, SERGE (1866–). A Russian surgeon, educated in Paris, and, after holding several posts in his native land, became a professor at the College of France, acting as director of experimental surgery. Following the theories of Brown-Sequard that certain animal and human secretions are quite similar, he grafted healthy animal glands into the human body, and attempted other operations to prolong the gland activity of human beings.

WAALS, JOHANNES DIDERIK VAN DER (1837–1923). Dutch physicist, who acted as professor of physics at Amsterdam from 1877 to 1907. He developed a theory of the continuity of the gaseous and the liquid states, discovered the law of binary mixtures, and did much work which enabled others to liquefy some of the stable gases. In 1910 the Nobel prize for physics was granted to him.

WALCOTT, CHARLES DOOLITTLE (1850–1927). An American paleontologist, who performed an important service in helping unite three government bureaus into the Geological Survey, acted as secretary of the Smithsonian Institution for 20 years (1907–27), and studied the early Cambrian and other fauna. In 1910 he unearthed very extensive and important deposits of Cambrian fossils in British Columbia.

WALLACE, ALFRED RUSSELL (1823–1913). British naturalist, who collected specimens in South America (lost by a fire in the ship that was taking them home), and spent some time in the Malay Archipelago. While at Sarawak, Borneo, 1855, he first conceived the idea of a law regulating species, which he stated as follows: "Every species has come into existence coincident in both time and space with a pre-existent closely-allied species." In Feb., 1858, during a fever, the idea of the survival of the fittest came to him, and he sent his statement to Darwin. The latter found it almost identical with his own views. A joint statement was read to the Linnean Society on July 1, 1858, sharing the credit for the theory. Wallace published several works, including *Speculations on the Origin of Species* (1855), *The Wonderful Century* (1898), *Social Environment and Moral Progress* (1910).

WEBER (*vā'bĕr*), **ERNST HEINRICH** (1795–1878). A German anatomist, for many years after 1840 professor of physiology at Leipzig, where he made important investigations of the sense organs, and expressed the relation of sensation to stimulation in terms now called Weber's law. He was one of the first to apply physics to psychology.

WEBER (*vā'bĕr*), **WILHELM EDUARD** (1804–1891). A German physicist, who developed a method and names for measuring electrical units; he proposed and defined the terms volt, ampere, coulomb, and farad, using names of celebrated physicists. Mathematical physics now owes a great deal to his early applications. After some study of magnetism, he developed a system of electromagnetic telegraphy about 1833.

WEISMANN (*vyse'mahn*), **AUGUST** (1834–1914). A German biologist; leader of the Neo-Darwinian school of evolutionists. The "all sufficiency of natural selection" is the keynote of his teaching in regard to the problems of heredity; he expanded the idea of the continuity of the germ-plasm, and propounded a theory of germinal selection.

WELCH, WILLIAM HENRY (1850–1934). Eminent American bacteriologist and pathologist, who was educated at Yale, and taught at Bellevue Hospital, New York, and Johns Hopkins, Baltimore, for many

years. Among his many contributions were those in relation to diphtheria, a new gas-producing organism or bacillus, and various surgical infections. He was the recipient of many degrees, honors, and offices of trust in medical and other associations. His works include *General Pathology of Fever, Bacteriology of Surgical Infections,* and *Throbosis and Embolism.*

WELLMAN, WALTER (1858–1934). Journalist and explorer; located Columbus's first landing place; led two polar expeditions, to 81 and 82 degrees north; (1906, 1908) attempted polar expeditions by airship.

WHITE, GILBERT. See under DICTIONARY OF AUTHORS.

WILEY, HARVEY WASHINGTON (1844–1930). American chemist, who was largely instrumental in the passage of various national laws protecting the public against misbranded foods and drugs. Having acted as state chemist and professor at Purdue University (1874–83), he became chief of the Bureau of Chemistry of the U. S. Department of Agriculture, resigning in 1912. From 1899 he was professor of agricultural chemistry at George Washington University. Author of *Foods and their Adulteration, Beverages and their Adulteration* and *Health Readers for Schools.*

WILKINS, GEORGE HUBERT (1888–). British explorer, who acted as photographer of the *Karluk* expedition under Stefansson (1913–18) and twice went to the Antarctic (1920–21, 1921–22), and twice from Point Barrow, Alaska, over the Arctic regions. In 1928 on April 21 he flew from Point Barrow to Spitzbergen; on this flight Carl Ben Eielson acted as pilot (d. 1929 in airplane accident near North Cape). Much information was gained, but no land was seen in the hitherto unexplored regions. He was created a baronet in 1928. On Dec. 19 he and Eielson flew over the Antarctic and found some new land there.

WILLISTON, SAMUEL WENDELL (1852–1919). American paleontologist and zoölogist; professor anatomy Yale (1886–1890); professor geology and anatomy University of Kansas (1890–1902); professor of paleontology at University of Chicago from 1902; author o *North American Diptera,* and many scientific paper particularly upon mesozoic reptiles.

WILSON, ALEXANDER (1766–1813). A Scottish American ornithologist. By association with Willia Bartram he became interested in ornithology; pub lished his *American Ornithology,* himself drawing th faithful pictures. In 1814 it was completed in nin volumes. It was issued in two volumes after his deat and, with a continuation by C. L. Bonaparte, in fou volumes in 1833.

WILSON, JAMES. See under DICTIONARY O RULERS AND STATESMEN.

WOHLER, FRIEDRICH (1800–1882). A Germa chemist, who studied at Marburg and with Berzeliu at Stockholm, and for 46 years was professor at Gö tingen. He obtained the metallic aluminum isolate beryllium, made important studies in uric acid, an showed the resemblance between titanium, silicon, an carbon.

WOLLASTON, WILLIAM HYDE (1766–1828). A English chemist and physicist; invented the "camer lucida," the reflecting goniometer, an apparatus fo measuring refractive power of solids; discovered palla dium, rhodium, and a method of making platinu malleable.

WRIGHT, ALMROTH EDWARD (1861–). British bacteriologist, who did important work i parasitic diseases, prepared an anti-typhoid inoculatio and conducted experiments in other substances de signed to make the human blood immune to certai diseases. In 1906 he was knighted, and during th World War acted as consultant to the armies i France.

WUNDT (*vūnt*), **WILHELM MAX.** See unde DICTIONARY OF PHILOSOPHERS.

YOUNG, CHARLES AUGUSTUS (1834–1908) American astronomer; professor of astronomy at Dar mouth (1866); Princeton (1877); discovered the re versing layer in the solar atmosphere and made valu able studies in solar phenomena.

ADAMS, JAMES TRUSLOW (1878–). An historian, born in Brooklyn and educated there and at Yale, with honorary degrees from various colleges. Member of a stock exchange firm until 1912. Served on commission headed by Col. House in the World War, later in the military intelligence, and as adviser in the Peace Conference. In 1921 his *Founding of New England* won the Pulitzer Prize. Other notable books are *Hamilton Principles* (1929), *Tempo of Modern Life* (1931), *America's Tragedy* (1935), *The Epic of America* (1935), translated into European languages, and *The Living Jefferson* (1936). Contributor and editor of various publications.

ADLER, MORTIMER J. (1902–). Advocate of better reading habits among the people. Dr. Adler, who was born in New York, found after taking his Ph. D. that he had no real method in his reading. Growing out of his own studies and experiments, he issued his *How to Read a Book*, which became a best seller. He joined the faculty of the University of Chicago in 1930, and has lectured widely on his specialties, philosophy and law. In *Art and Prudence* (1937), he discusses the relations between art and morals in the light of ancient philosophers, such as Plato, Aristotle, and St. Thomas Aquinas. Among his other works are *Dialectic, Crime, Law*, and *Social Science* (with Prof. Jerome Michael) and *What Man Has Made of Man*. In *Art* and *Prejudice* (1937), one section on motion pictures discusses the question of censorship and regulation.

ALLEN, FLORENCE E. (1884–). She was the first woman assistant prosecutor of a county in Ohio; first woman to sit in a court of general jurisdiction in the United States (Ohio Court of Common Pleas); first woman to preside in a court of last resort (Ohio Supreme Court); and first woman member of a U. S. high court of appeals. She advised persistency, a sense of humor, and "don't be emotional" to any women taking up the study of law. Her father was professor of Latin and Greek in Western Reserve University until compelled by poor health to take up his residence in Utah, where he became the first Congressman from that state and where his daughter was born in Salt Lake City.

Florence Allen could read at four; took up Latin at seven; and Greek at eight, under her father's instruction. She was ready for college at fourteen, but waited to study music for two years; then went to Western Reserve for an arts course; followed by specialization in music with a year in Berlin; taught for three years; and acted as music critic for the Cleveland *Plain Dealer* (1906–09). Then she took up political science, completed a law course at New York University, and was admitted to the bar in 1914. Her progress in Cleveland as a lawyer was steady and rapid. She became assistant prosecutor for the county in 1919; justice of the Supreme Court of Ohio in 1922, and was reelected in 1928 with 350,000 majority; and judge of the Sixth District of the Federal Court of Appeals in 1934. Her book *This Constitution of Ours* was published in 1940.

ANDERSON, MARION (1908–). Since she sang in the junior choir in the Union Baptist Church of her birthplace, Philadelphia, this gifted negro singer has steadily made her way to the heights of fame. Toscanini, the great conductor, said, "A voice like hers comes once in a century." Since 1925 when she won against 300 other singers in the contest at Lewisohn Stadium in New York, some of her chief performances have been those before the kings of Norway and Sweden and the Finnish composer, Sibelius, and at the White House in Washington. She won the Spingarn Medal in 1939. Among her repertoire of over 200 songs in nine languages, she regards the negro spirituals as her favorites.

ANGELL, NORMAN (1874–). Celebrated political scientist, born in England and educated there, in France and in Switzerland. He first came to America in 1891 and worked as a farm hand, waiter, cowboy, prospector, and journalist. He returned to England in 1897; then became editor of an English daily paper in Paris and started the *Paris Daily Mail* for Lord Northcliffe, with whom he was associated for ten years. By 1940 he had to his credit at least 15 books on economic, political and allied topics. He was knighted in 1931 and given the Nobel Prize for literature in 1933. Some of his books are the *Story of Money* (1929), *Preface to Peace* (1935), *Peace with the Dictators?* (1938), and *America's Dilemma* (1940). His *Great Illusion* (first issued in 1908) went through over 100 editions in 20 languages. The thesis of this famous book is that nations are under a great illusion when they think that addition of territory by war means any particular addition of wealth.

ARNOLD, THURMAN W. (1891–). As assistant attorney general in Washington, Arnold showed no favors in the prosecution of cases regarded by the government as violations of the anti-trust laws. He was called from a professorship in law at Yale in March, 1939, to enter the government service in a stiffer enforcement of the existing laws, after a congressional investigation. In a little over a year, in 74 indictments involving 680 individuals, 200 of these were union representatives, 214 corporations, 58 labor unions, 32 trade associations and other associations, and only one partnership. Arnold is a graduate of Princeton and of the Harvard Law School, went west to Laramie, Wyoming, where he was mayor, member of the legislature, and then was called to West Virginia University as dean in law.

BAKER, NEWTON D. (1871–1937). As Secretary of War in the cabinet of Woodrow Wilson, Baker had general charge of the drafting of over four million men, half of whom were sent abroad. He once had said he was such a pronounced pacifist that he would be willing "to fight about it." His fame rests on the skill, energy, and fairness of his department in trying times. He was a graduate of Johns Hopkins and, in law, of Washington and Lee University. After a year as secretary to the postmaster general in 1897, he took up the practice of law in Cleveland, where he soon became an active and notable citizen. From 1905 to 1909 he was City Solicitor, and from 1912 to 1916, Mayor of Cleveland, where his ability attracted Wilson. Baker took a small, untrained, poorly equipped army, chose John J. Pershing to hasten the preparations for active service, and by 1918 was sending 10,000 men a day abroad. In 1921 he returned to Cleveland and became adviser in many important cases. He favored the World Court and United States entrance into the League of Nations. In 1929 he became a member of the Hague tribunal and also chairman of the federal crime commission. In 1933 the National Institute of Social Science gave Baker a medal for distinguished service to humanity, a similar honor having been awarded him by the government in 1928. Baker was a native of West Virginia.

BANKHEAD, WILLIAM B. (1874–1940). Speaker of the House of Representatives, who came from a family of legislators. His father also represented Alabama for years in the House, and his brother, John H., was Senator from that state, having defeated Tom Heflin in 1930. The family was prominent in Alabama industry, in the Methodist church and against the Klan. W. B. Bankhead played fullback on the University of Alabama team, became a member of Phi Beta Kappa, and established a reputation in college theatricals. Two of his daughters, Tallulah and Eugenia, have distinguished themselves on the American stage. After turning from the stage as a career, Bankhead for a time was a lawyer and political speaker in New York, but went back to Alabama to become his brother's law partner in 1900. He represented Madison County in the Legislature, then was City attorney of Huntsville for four years, and also from 1900 to 1914 served as solicitor on the fourteenth Judicial Circuit. He served in Congress from 1917, knew parliamentary law as few have, and so was made chairman of the Rules Committee in 1934. On Jan. 2, 1935 Bankhead became majority leader, and in June, 1936, succeeded his friend Byrnes as Speaker of the House. Bankhead showed considerable strength in the Democratic Convention of 1940, continued to work and speak for his friend, the President, and was stricken suddenly while speaking.

BATES, ERNEST S. (1879–1939). He is known best by his *The Bible Designed To Be Read as Living Literature* (1936), which was a best seller in both America and England. After one year at Columbia, he became a teacher of English at the University of Oregon for 17 years, resigning in 1926 to become a free-lance author. As book reviewer for the New York *Herald Tribune*, he became known for sound and varied learning. Among his other works are *The Story of the Supreme Court, The Story of Congress, This Land of Liberty*, and *Mary Baker Eddy—The Truth and the Traditions* (with J. V. Dittmore). On Dec. 4, 1939, a few minutes after completing his *American Faiths*, a book on religious beliefs, he dropped dead of a heart attack in New York.

BEDIER, JOSEPH (1864–1938). In 1920 he took the chair in the French Academy vacated by the death of the poet Rostand, on the basis of his *Tristram and Iseult*. He was known for many years as a profound student of French and English literature. He was called to lecture at Harvard (1909), Columbia (1923), University of California (1927), and at the College of France, of which he was administrative head from 1929 to 1936. His chief works are *The Fabliaux, Critical Studies, Songs of the Crusades*, and *Epic Legends*.

BENES, EDUARD (1884–). Patriot and former president of Czechoslovakia; educated in Prague, Dijon, and Paris. He was a protégé and assistant to Thomas G. Masaryk, and was Minister of Foreign Affairs of his country (1918–25), premier (1921–22), and president (1935–38), resigning after the Munich pact. He had also been a member

of the Council of the League of Nations. After coming to America, he taught history at the University of Chicago, lectured widely, and counseled his countrymen and other European refugees in the United States.

BEVIN, ERNEST (1884–). British Minister of Labor in the Churchill Cabinet, and formerly secretary of the Transport Workers Union. After the usual education in the schools, Bevin took a post on the *Daily Herald*, organ of the workers of England. In 1937 he was chairman of the General Council of the British Trades Union Congress. He visited the United States and spoke at a dinner with Lord Stanley Baldwin as the chief guest of honor. In the coalition war cabinet, Bevin has as much power as any king of England since the Middle Ages, with authority given him to direct the labor, hours, and wages of any person in the realm. In this position Bevin did much to unify the sentiment of the workers for defense of their homeland.

BIRGE, RAYMOND T. (1887–). Dr. Birge received his education in Brooklyn, New York, and at the University of Wisconsin, where he won the usual degrees. After teaching at Syracuse University from 1913 to 1918, he went to the University of California, where he became a professor in 1920, chairman of the department of physics in 1933, and the discoverer of a radioactive form of carbon which promises to lead to very important results in the study of the germs that cause disintegration of tissues.

BLACK, ALEXANDER (1859–1940). This versatile editor, author, and inventor, known as "the father of the photoplay," brought out the first screen drama, in slow motion, in 1894. He was the first president of the department of photography of the Brooklyn Institute. He began as reporter at 16, was literary editor of the *Brooklyn Times* for 11 years, Sunday editor of the *New York World*, 1905 to 1910, editor of Newspaper Feature Service, 1913 to 1926, and art editor, King Features, 1926 to 1935. Black was also the author of a score of books, including his reminiscences, *Time and Chance* (1937).

BLACK, HUGO L. (1886–). Appointed to the Supreme Court in August, 1937, in the face of considerable opposition and accusations that he had been a member of the Ku Klux Klan. Beginning the practice of law at Birmingham in 1907, he was police judge in 1910–11, prosecuting attorney from 1915 to 1917 in Jefferson County, Alabama, and then from 1919 to 1927 in general practice at Birmingham. When appointed to the court, he was serving in the fourth year of his second term as United States Senator. Black was the first of the so-called New Deal appointees intended to liberalize the theories of the Supreme Court.

BLAKE, JOSEPH A. (1864–1937). Known for his Blake Splint for the reduction of fractures in surgery. During the World War he was asked to supervise hospitals with the French, British, and American armies. At the close of the World War he was in the Sixth Army Corps Hospitals. He was decorated in the French Legion of Honor and given the United States Distinguished Service Medal. Dr. Blake was educated at Yale and at the College of Physicians and Surgeons of New York, later serving as a professor at P. and S. He served at times as surgeon at the Orthopedic, St. Luke's and Roosevelt Hospitals in New York City, at the St. John's in Dobbs Ferry, and in Tarrytown hospitals.

BOOTH, EVANGELINE (1865–). She was the fourth daughter of General William Booth, having been born in the year when the East London Mission, forerunner of the Army, was established. Her training began at an early age and at 20 she was placed in charge of one of the worst districts of London, where she did such noteworthy service that all of London was put under her command in a few years. Acting as a shop girl and servant, she gained much insight into the conditions and ideas of the London poor. She won the right of the Army to hold outdoor meetings, the first of the well-known street corner Salvation Army services. From 1895 to 1904 she was in charge of activities in Canada and from 1904 to 1934 in the United States. She led a party of religious workers in the Klondike gold fields when the great rush was on from 1897 to 1900. During the first World War, Miss Booth established the Salvation Army as a respected agency for good in France. Later a thank offering in appreciation of the work of the Army during that time grew to thirteen million dollars. She felt obliged to oppose her brother, Bramwell Booth, who had succeeded his father as General of the Army. Through her efforts in 1929 it was decided that a new leader should be elected by the chief officers and should not be appointed by the retiring general. Edward J. Higgins became General at that time and served until 1934 when Miss Booth returned to London to take over that position. The United States awarded her a Distinguished Service medal and Sweden gave her the gold medal of the Order of Vasa.

BUCK, PEARL S. (1892–). This gifted author of *The Good Earth* and other books interpreting China to the western world was born Pearl Sydenstricker at Hillsboro, West Virginia. At an early age she went with her missionary parents to China, where she remained until she was 17. The she returned to this country for a course at Randolph-Mac College in 1910, after which she returned to China as a mi sionary until 1933. While on furlough she took her A. M at Cornell in 1926. In China she taught at three colleges Nanking. Her first novel of oriental life was *East Wind West Wind* (1929), which treats of the aspirations of the pea ants of China, as do several of her other books. The chi ones besides her Pulitzer prize *Good Earth* (1933) are *T Mother* (1935), *The Exile* (1936), *Fighting Angel* (1936), a *Other Gods*, an American legend (1940). Some critics hav pronounced Mrs. Buck the first real interpreter of the commo people of China for English-speaking people. In 1917 s married John L. Buck of the state of New York, and in 193 Richard J. Walsh. Afterward she lived in Pennsylvani

BURLIUK, DAVID (1882–). An artist of inte national background, born in the Ukraine, and since 192 a resident of the United States. After military service an study in Odessa, he went to Paris where he fell under th influence of the work of Von Gogh. Later he became one the Blue Riders, a group of young German painters, and al a poet of some fame. After painting in the Urals just aft the World War, he spent two years in Japan. He quickly b came a lover of American scenes, particularly of villages an shores, but he never could forget the homes of the Russia peasantry. His work appeared in various one-man exhibitio in San Francisco, Philadelphia, and Portland, Oregon.

BUTLER, ELLIS P. (1869–1937). From the time he wrot *Pigs Is Pigs*, published in 1906, Butler was known far an wide as an American humorist. His books number over 3 some of the best known ones being *The Incubator Baby* (1906 *Great American Pie Company* (1907), *Adventure of a Subu banite* (1911), *Goat's Feathers* (1919), *Ghosts What Ain't* (1923 and the *Behind Legs of the 'Orse* (1927). Butler was a leade in our modern style of American fun-making.

CARVER, GEORGE W. (1864–). Negro chemist the Tuskegee Institute in Alabama, whose work in assistin agriculture is little short of marvelous. He was born i slavery in Missouri, was stolen by night-riders when a youn baby, ransomed by his master, brought up in his family an given his name. Carver worked his way through schoo at Minneapolis, Kansas, and then through Simpson Colleg and Iowa State College, where he became an assistant i botany. Booker Washington called him from there to Tuske gee. Carver found 300 uses for the peanut, new stains an dyes from common clays, paving squares from cotton, a oil remedy for infantile paralysis, 100 uses for the swee potato, and 60 from the pecan. He won many medals an was made a member of the British Royal Society of Arts, a honor shared by few Americans. Edison once offered hi $50,000 a year to do research for him; a Mississippi compan offered to let him name his own figure to become chemist fo it,—and moved to Tuskegee (to accept free advice from him when Carver refused. In 1940 Dr. Carver gave his life-saving of about $30,000 to provide for research at Tuskegee. I April of that year a special film was made to show his wor and life story.

CASE, ANNA (1889–). She was born at Clinton, N. J. and first sang in public in the choir at Plainfield. In 1931 sh married Clarence H. Mackay. In 1909 Miss Case made he début at the Metropolitan Opera in New York, where sh remained until 1916, playing such important rôles as Sophi in *Der Rosenkavalier*, Olympia in *The Tales of Hoffmann* and Micaela in *Carmen*. For years she was also a favorit soprano on the concert stages of Europe and the Unite States.

CHAMBERLAIN, NEVILLE (1869–1940). His father Joseph Chamberlain, once declared that Neville never coul become a political leader. During the first World War David Lloyd-George asked Chamberlain, then an industria leader in Birmingham, to see if he could coordinate and speed up British industry. His attempt was not a great succes and in seven months he was back at his own business desk again. He declared public office had no charm for him. Ye in 1918 he was elected to parliament and from then on wa active at various times in party councils. In 1937 he wa recognized as leader of the Conservative Party. Meanwhil he had been Postmaster General, 1922–23; Minister of Health 1923, and 1924–29; also Chancellor of the Exchequer fo part of the time, and again from 1931 to 1937. He wa premier from 1937 to 1940 when popular opposition forced him to retire in favor of Winston Churchill, who had been a vigorous leader in the first World War. He was given the nominal position of President of the Council. Few men for a brief period have been more popular in England than Cham berlain and few in recent times have suffered such a quick eclipse. His policy was that of friendly cooperation and appeasement. He reasoned that kindness and conciliation would win friends and soften enmities. When he returned from th conference with Hitler at Munich in 1938, Chamber

lain supposed he had insured the peace of Europe for years to come. His own disillusion was even more bitter, if possible, than that of his countrymen who had relied on his statesmanship to steer them clear of war. After he resigned as premier, his ill health increased and his spirit was completely broken.

CHARCOT, JEAN B. (1867–1936). Eminent French explorer who turned from a brilliant career as the young chief of clinic in the Paris Faculty of Medicine in 1896, and devoted his life to many hardships of polar scientific research and discovery. On two extensive explorations of the antarctic regions (1903–05 and 1908–09) he made many discoveries in the South Shetlands, Weddell Land and Adelaide and Graham Islands in a land of more than 10,000 icebergs. In the World War he won the Distinguished Service Cross and the Croix de Guerre. In 1936, with 38 of his men, he was drowned off western Iceland when their ship the *Pour Quois* was driven on rocks. Some of his notable works are *Around the South Pole* (2 vols.), and *Navigation Made Easy*.

CHIANG KAI-SHEK (1888–). Chiang seems to have been recognized as the natural successor to Dr. Sun Yat-sen, who was called the George Washington of China. He disliked his school, ran away to join the forces, lived for four years in Japan attending military school, and returned to suffer many turns of fortune. He became closely associated with Dr. Sun Yat-sen, founded a military academy, and gradually fought off many of those groups seeking to keep China disunited. After a while in Russia and later under Red influences, he sought to break away at a time when his armies needed help and the people began to demand too much of him. Certain opposition led to his temporary withdrawal, but he was soon asked to take charge again.

Under the influence of his banker friends, he married Soong Mei-ling, a graduate of Wesleyan College and a convert to Christianity. Her influence over him and China has turned affairs into western ways of thinking. The climax of Chiang's career came in December, 1936, when he was a prisoner for two weeks and vigorously threatened by an ally of his, former Marshal Chang Hsueh-liang. As a result of terms agreed upon by these men, Chiang ceased to war against the Russian interests and turned all his forces toward the resistance to Japan. Chiang, recognized as the outstanding military leader of China, was more successful than any other person in uniting all elements. As the Japanese cut off the coast and moved inland, he moved his modern rebuilt capital from Nanking to Hankow, and when Hankow was taken, the capital was moved to Chungking far in the interior. Even here he was beset at times with internal troubles of the 4th and 8th route armies under communistic training and influence.

The outstanding achievement of Chiang is the "Westward Trek" of Chinese thought and culture, whole colleges being moved to the interior provinces which up to then had never been influenced by modern civilization. Here, not only colleges, but thousands of small local cooperatives have been established, making resistance to Japan—with what supplies come overland from Russia and by way of the Burma Road—possible.

CHRYSLER, WALTER P. (1875–1940). At 17 he began work as a wiper of locomotives in a roundhouse at five cents per hour, and at 36 he was manager of the American Locomotive Company in Pittsburgh. Then General Motors Company offered him a position as works manager for the Buick, of which he became president and general manager, 1916–19. Next he was vice-president of the Willys-Overland Company, and chairman of the committee to reorganize the old Maxwell Company. In 1924 he put the Chrysler on the market and sold $500,000 worth the first year. In three years his companies stood among the big three in the automobile world, with the Chrysler, Plymouth, Dodge and DeSoto cars. Chrysler was known for his successful innovations. After 1935 Chrysler organized other companies, one of which built the immense building in New York City which bears his name.

CIERVA, JUAN DE LA (1896–1936). Inventor and developer of the autogiro, born in Spain, but spent much of his life in England where he was killed in an airplane accident. In March, 1924, he made his first helicopter, after which he toured Europe, and finally obtained help to start a factory in England. Some of his early flights were those from London to Paris in 1928; 12,000 feet over Madrid in 1929; and various demonstrations before scientific bodies. He won the chief prizes for development of safer aviation, including International Aviation Gold Prize in 1932, the Franklin Institute prize, and the John Scott Medal. Cierva's chief feat was the development of the rotor blades and of a machine that would move forward, backward, and sidewise, and which could be held in the air for a space of time in almost any desired location.

COMPTON, KARL T. (1887–). He was the son of a Presbyterian minister who became a professor of philosophy at Wooster College in Ohio, where Compton himself obtained his first degree and also where he taught chemistry for a year after obtaining his Master of Science in 1909. He obtained his doctorate from Princeton in 1912; went to Reed College in Oregon for two years and then to Princeton as assistant professor of physics. In 1929 he became head of the department of physics at Princeton, but resigned in 1930 to become president of the Massachusetts Institute of Technology. There he sought a closer relationship between purely scientific subjects and general culture. With the establishment of a new Division of Humanities and a five-year course to permit the student to combine practical work with theoretical courses, the Institute began a new era in scientific progress. As Compton became more interested in social and political movements, he aided the government on several advisory bodies. At the same time, he took much interest in the students in his Cambridge technical university. He served as president of the American Physical Society from 1927 to 1929 and as President of the Association for the Advancement of Science in 1937. Since he became a busy executive, he has taken time out to continue his own research work in atomic physics, in which he is a world authority.

CONANT, JAMES B. (1893–). He was the son of a photoengraver in Dorchester, Mass., obtained his preparation for college at the Roxbury Latin School, and his A. B. at Harvard in 1913, completing his course in three years and taking special work in chemistry. In 1916 he was awarded his Ph. D. in the same field. During World War I he was one of the experts working in the Chemical Welfare Service, where he learned to control one of the deadliest gasses yet manufactured by man. After completing a great plant at Cleveland for the making of chemicals, he was raised to the rank of major in the service. He then returned to Harvard where he became a full professor of chemistry in 1927 and in 1931, chairman of the department. In 1933 he was chosen to succeed Abbott L. Lowell as president of Harvard University because of his progressive ideas in education. At Harvard he has stressed research by members of the faculty, at the same time assisting professors to obtain a broad general background for their work. He established several new University Professorships, the object of which is to allow professors to teach outside the regular routine of their own departments. In 1941, during World War II, he was sent on a government mission to England.

CURTISS, CHARLES (1860–1936). Thirty-first vice-president of the United States, who was born in Topeka, Kansas, admitted to the bar there in 1881, and gained a reputation as a cautious and astute politician. He was county attorney of Shiwasee County, sat in the House of Representatives from 1893 to 1907, and then in the Senate to fill out the term of J. R. Burton. He served until 1912 and again from 1917 to 1929, when he was elected vice-president. On March 4, 1933, he retired to practice law in Washington. Curtiss was known as a genial and impartial presiding officer of the Senate. He was one-eighth Indian of the Kaw Tribe of Kansas, and as a child lived among the redmen for a time.

DALADIER, EDOUARD (1884–). Daladier entered French politics shortly after the first World War. His long popularity came from the fact that he was of peasant stock and appealed to the common run of the French. Military service in the trenches added to his early fame, with three citations for bravery in action. In 1924 he took his first cabinet post, became the leader of the Radical-Socialists, Minister of Public Works in three cabinets, and finally in 1933 Premier, also being Minister of War. He carried on until October 24, 1933, was in office again for 11 days in 1934 and again on April 4, 1938, following the resignation of the leftist Blum cabinet. Daladier followed Chamberlain's policy at Munich. He wanted to help Finland during the Russo-Finnish War, but the immediate crisis at home prevented it. At last, tired of turmoil and opposition, he suddenly resigned on March 19, 1940, but served briefly as Foreign Minister in the next cabinet of Reynaud.

DEWEY, THOMAS E. (1902–). In 1937 Dewey was elected by a margin of over 100,000 the first Republican District Attorney of New York City in about two generations. He was the candidate of the factions opposed to Tammany methods, and was favored by Mayor F. H. LaGuardia. He was born at Owasso, Michigan, son of the county chairman and postmaster of that city. After receiving his A. B. degree at Michigan, 1923, he attended music school at Chicago on a scholarship. He soon entered Columbia Law College and began active practice in 1925. In 1931, after practice with three different firms, he became assistant to George Medaile, United States Attorney for the Southern District of New York. When Medaile resigned; Dewey became his successor during the first important trial of racketeers that he had attempted. From this time on his name was associated with various investigations, trials, and convictions of many figures known to the underworld. In 1936 the case that attracted wide publicity was that of the "King of Vice" in New York, with nine convictions at the end. Dewey ran against Herbert Lehman for the governorship and lost by so close a margin that a shift of 35,000 votes would have elected him. From that day he was carefully groomed as the likely candidate for the presidential nomination by the Republicans. He made

the longest pre-campaign tour of any candidate for this nomination and was highest at the start of the balloting in Philadelphia, but, after suffering a rapid decline of strength, threw his votes to Wendell Willkie. During the campaign which followed he was one of Willkie's most effective campaigners on a great national tour.

DIES, MARTIN (1901–). Born in Texas, son of a former member of Congress, and a man of deep convictions and fearless temper. In 1931, while still under 30 years of age, he became a member of the House. He kept trying until 1936 to start one investigation after another (seven in all), and finally, in 1938, was made chairman of a committee to investigate un-American activities, after Fritz Kuhn and his Bund had been exposed in New York. As a result of their work, Dies and his committee were showered with bouquets and brickbats with almost equal fervor. Early in 1940 the first full report of the committee appeared—a document of 7,000 pages.

DILL, JOHN GREER (1881–). Chief of the British General Imperial Staff, called by some "our greatest general since Marlborough." Dill won his way by kindness and sympathy with all ranks of soldiers, never by harsh and exacting methods. He was always known as a leader of soldiers. His background is that of a family of Irish Protestants of Belfast, Ireland. After a course in the Military College at Sandhurst, he served in the last of the Boer War in South Africa, winning the Queen's Medal for ability and bravery. His promotion in the army was very slow, although twice at least he was jumped over several men of longer service. In 1911 he became a captain and won numerous honors and medals during the first World War, but did not become a colonel until 1920. From 1923–26 he commanded the Second Infantry Brigade. In 1929 he went to India as brigadier on the General Staff; in 1930 he was made a major general; in 1931 commander of the Staff College at Camberley; in 1934 director of Military Operations and Intelligence in the War Office. Later he studied the grounds and results of the World War in central Europe. In 1936 he quelled an uprising in Trans-Jordania with a minimum of bloodshed. Even the rebel Arabs admired his methods. He then became a general and in 1939 was sent to France. In 1940 he succeeded Edmund Ironside as Chief of Staff. Dill was always recognized as a conciliator, not a driver. In London he worked faithfully and heartily with the government of Churchill.

DISNEY, WALTER E. (1901–). What child does not know of the animated cartoons of Walt Disney? The artist grew up in Chicago and was educated there and in Kansas City. During the World War, Disney was an ambulance driver for the Red Cross, and in 1919 became a commercial artist. After two years of general work in Kansas City, he began to draw for the Alice Comedies, a combination of a live girl and animated figures. In 1926 he began to make the pictures of Oswald, the Rabbit, for Universal. In 1928 he formed his own company which produces the Mickey Mouse and Silly Symphony cartoons. In 1938 he presented his *Snow White and the Seven Dwarfs* which was the most ambitious attempt in such productions up to that time, and which became tremendously popular in all parts of the world. As a result of his work, he has received many awards, decorations and other recognitions.

DODD, WILLIAM E. (1869–1940). Because he had been awarded a Ph. D. after graduate work at Leipzig University in Germany in 1900, and knew the people and language well, President Roosevelt in 1933 persuaded Dr. Dodd to exchange a professorship in American History at Chicago for the ambassadorship to Germany. Under the regime of President von Hindenburg much had been done to restore friendly relations between our country and the German people. Dodd found it impossible to serve when Hitler came into power, as Americans were insulted for not saluting the Nazi flag and otherwise humiliated; and so Dodd resigned in 1937. He was a graduate of the Virginia Polytechnic Institute (1895), taught there for two years, and from 1900 to 1908 was a professor at Randolph-Macon College and then was called to the University of Chicago. As Dodd left Germany, he asked, "In a vast region where religious freedom is denied, where intellectual initiative and discovery are not allowed, and where race hatreds are cultivated, what can a representative of the United States do?"

DOUGLAS, WILLIAM O. (1898–). He was the son of a Presbyterian minister who emigrated from Nova Scotia to Minnesota, where the son was born, and where the father died in 1909. Douglas worked his way through Whitman College (A. B., 1920) by doing all sorts of work. In the World War he served as a private. In 1925 he completed a law course at Columbia where he edited the *Law Review* in his senior year, and then entered a law office which specialized in financial business. From 1925 to 1927 he lectured on law at Columbia and was an assistant professor before going to Yale in 1928. In 1932 he became Sterling Professor at Yale, an uncommon distinction for such a young man. On March 20, 1939, he became Associate Justice of the Supreme Court succeeding Louis D. Brandeis, one of the five youngest men ever to hold that position. The chief objection by some against his appointment to the Supreme Court was his youth and limited practice of law. Douglas is the editor and author of several texts and law books.

DURYEA, CHARLES E. (1861–1938). Maker of the first practical automobile in America at Chicopee, Mass., in 1892. Duryea's automobile and one by Haynes are now in the Smithsonian Museum in Washington, D. C. His improved models took prizes for a number of years—in New York in 1895, and the next year in London against foreign makes. By 1896 he was turning out a car a week at $1,000 each in his Springfield, Mass. plant. Two years later he had developed three cylinders, planetary transmission, steering rod, a hand gear for two forward speeds, and a pedal on the car for reversing. The speed was 12 to 15 miles an hour. In 1902 Duryea closed his factory at Reading, Pa., and became interested in other projects and scientific experiments. He was a zealous advocate of a simpler form of spelling.

DYKSTRA, CLARENCE A. (1883–). American educator and business man, born in Cleveland, Ohio, the son of a minister in the Dutch Reformed Church; received his college training at the State University of Iowa, with a year as a fellow in history at Chicago. From 1909 to 1918 he served as a professor of political science at the University of Kansas. From then until called to the University of Wisconsin in 1937, he served as secretary of the city leagues in Cleveland, Chicago and Los Angeles, and then for seven years as city manager of Cincinnati. In this last position he introduced economy and efficiency, with many improvements and no additional cost to the taxpayers, until Cincinnati had the lowest tax-rate of all cities of its kind and class. When he was called to Washington by President Roosevelt, he was granted a leave of absence by the University, and on October 17, 1940 he became director of the Selective Service in Washington with unanimous approval by the Senate.

EDEN, ANTHONY (1897–). British statesman. After winning honors in oriental languages at Eton and Oxford in England, Eden went to France as captain of a rifle corps, and there won the Military Service Cross. From 1923 to 1935 he sat for Leamington in the House of Commons where he soon became known as a thinker and able speaker. From 1926 to 1929 he was secretary to Austen Chamberlain, then Secretary of State for Foreign Affairs, and from 1931 to 1935, under secretary for Foreign Affairs. In 1934–35 he served as Lord Privy Seal, and then minister without portfolio for League of Nations Affairs. Eden succeeded Sir Samuel Hoare as Minister of Foreign Affairs (1935–1938) and in 1939 became Secretary of State for Dominion Affairs. He tried to prevent the war in Ethiopia and won fame for his vigorous efforts to maintain world peace, although advocating a firm policy towards Germany. He was let out of the appeasement cabinet of Chamberlain because of his German attitude. After Churchill became Prime Minister and after Lord Halifax was appointed to Washington, Eden became Minister of Foreign Affairs.

EDWARD VIII (1894–). Succeeding his father George V, Edward Windsor ruled the British Empire and Commonwealth of Nations from January 20 to December 11, 1936. The incidents leading to his abdication caused much uncertainty in the Empire, for he had been an exceedingly popular Prince of Wales, world traveller, and enlightened monarch in the few months of his reign. He was trained for naval service at Osborne College and the Royal Naval College at Dartmouth, England. His father created him Prince of Wales and Earl of Chester following his graduation in 1911. He became a midshipman in the navy, studied French in Paris, and entered Magdalen College, Oxford, in 1912. In 1914 he became aide to Sir John French in the World War, served for 18 months in France, then with the Mediterranean Fleet, at the Italian front, and with military units from Australia and Canada until 1919.

Edward became zealous in sports, travel and learning the ways of diplomacy. No British monarch ever came to the throne better schooled in certain details. His journeys took him to the United States and Canada in 1919; to New Zealand and Australia the next year; to Gibraltar and other parts of the empire in 1921–22; again to Canada in 1924, where he owned a ranch; to East Africa in 1928 and 1930. Yet the details of ruling soon became distasteful and his interest in Mrs. Wallis W. Simpson led him to abdicate the throne in favor of his brother, George, on Dec. 10, 1936. On the following night he went into voluntary exile, later lived in France where he married Mrs. Simpson, and in the first months of the second World War was recalled to military service in France. In 1940 he was appointed governor of the Bahama Islands. One of the first acts of his brother was to create Edward the Duke of Windsor.

ELIOT, GEORGE F. (1894–). Military critic. He was born in Brooklyn, but was taken to Australia at the early

age of eight. He earned his title of major in the service (1922–1930) in the Military Intelligence Reserve. Meanwhile he acted as an accountant in Kansas City where he began to write war narratives. Major Eliot's right to fame as a critic of military affairs and strategy dates from his four-year service with the Australians in the first World War. In 1928 appeared his first military writing of note in *The Infantry Journal* and the *U. S. Naval Institute Proceedings*. His popular books, appearing in yearly succession, are *If War Comes* (1937), *The Ramparts We Watch, Bombs Bursting in Air*, and *Strategy Map of Europe* (May, 1940). As lecturer, writer for magazines, and especially as a radio commentator on the European war, Major Eliot became known to millions of Americans.

FAIRBANKS, DOUGLAS (1883–1939). American actor, born in Denver; died in Santa Monica, California. He was Douglas Ulman, son of H. Charles Ulman, a New York lawyer and Shakespearian scholar, who was at that time interested in mining projects in Colorado. At 12 Douglas could recite whole plays of Shakespeare from memory. He first planned to enter mining after a course at the Colorado School of Mines; he also tried business and law before he finally settled down to acting. Meanwhile, he had first appeared on the stage with the Frederick Warde Company at Richmond, Va., in *The Duke's Jester*. In 1901 he legally changed his name to Douglas Fairbanks. He went to London and first played in *Fantana* under Lee Shubert. For five years he was with the William A. Brady Company, some of his earliest rôles being in *Frenzied Finance, As Ye Sow*, and *Man of the Hour*. In 1911 he began to appear in the Cohan and Harris companies. His first appearance at Hollywood in 1914 was with David W. Griffith; in 1917 he organized his own company, and two years later joined with Mary Pickford, Griffith, Charles Ray, and Charles Chaplin in forming United Artists, which became a great producing company. Some of Fairbanks' popular parts were in *Robin Hood, Thief of Bagdad, Three Musketeers, The Black Pirate, Iron Mask*. In 1934 he acted in his last picture, *Private Life of Don Juan*, and at the time of his death he contemplated returning to the screen. In 1920 he married Mary Pickford from whom he was divorced in 1925. In 1935 he married Lady Ashley, divorced wife of an English lord. This was his third marital venture.

FARLEY, JAMES A. (1888–). American politician. He began his public career in Rockland County, N. Y., where he was town clerk of Stony Point (1912–19), after which he became port warden of the City of New York by appointment of Alfred E. Smith, then governor. Farley was a supervisor in 1920–23, Democratic county chairman, 1919–29, and had one term in the Legislature, being defeated when he ran again because he voted wet. In 1930 he became chairman of the Democratic State Committee of New York. One of the early campaign promoters of President Roosevelt, he was appointed by him as postmaster general in the Cabinet from 1933 to 1940. After the Democratic Convention in 1940, he left the Cabinet and resigned as chairman of the party plans to return to private business. In national affairs, Farley came to be known as a genial, astute, and capable official.

FRANKFURTER, FELIX (1882–). Jurist and politician, born in Austria, educated at the College of the City of New York and in Harvard Law School. Assistant District Attorney for the Southern District of New York, 1906–1910; law officer, Bureau of Insular Affairs until 1914; professor of law at Harvard, 1914–1939. In 1932 he declined appointment to the Massachusetts Supreme Court; was visiting professor of law at Oxford University, 1933–34; later became assistant to the Secretary of War and counsel to the President's Mediation Commission. In 1939 he was appointed to the Supreme Court to succeed Benjamin Cardozo. Author of many articles and books, among them being *Business of the Supreme Court* (with James M. Landis), *The Public and Its Government*, and *The Commerce Clause under Marshall, Taney, and Waite*. Editor of *Cases on Federal Jurisdiction* (with Harry Shulman).

GALLUP, GEORGE H. (1901–). Statistician and founder of the American Institute of Public Opinion, born in an Iowa farming community. He helped earn his way through the State University, and there began the experiments which proved him a master in sensing public opinions. His first survey, it has been related, was to find the most beautiful girl on the college campus; then he married her. For his Ph. D. thesis he studied reactions of readers through questioning a small, selected group of them. Later he taught journalism at Drake and Northwestern Universities. In 1932 he entered a New York advertising firm. Three years later he sent out his first test questions to find the national reactions to some features of the New Deal. Since then he has used questionnaires, but chiefly certain investigators in many parts of the country. The accuracy of his polls is well known; at times when tested, as in national elections, the results vary less than 5% of predictions. Among his published works is the *New Technique for Measuring Reader Interest*.

GAMELIN, MAURICE G. (1872–). He was born across the street from the War Ministry in Paris, of a line of generals on both sides. His mother was a distinguished painter. Gamelin was designed for a literary career, but later was sent to St. Cyr, French school for officers, and ranked first in a class of 449 at graduation. In 1895 he became a lieutenant, a captain of chasseurs in 1904, and a confidential adviser on the staff of General Joffre from 1906 to 1911. Gamelin was credited with the strategy that turned back the Germans from Paris in 1914. Later he was in Brazil, assisting the reorganization of the army there, and then in Syria. In 1931 he became chief of staff at Paris. Between then and the second World War, he advocated preparation, mechanization, and improvement of the French fighting units. During the invasion of France and the Low Countries, Gamelin was allied commander, until replaced by General Maxime Weygand on May 19, 1940. His eventual retirement, when France failed to resist, was then attributed to inaction, of which he had frequently criticized the government.

GARNER, JOHN NANCE (1869–). Vice-president and statesman, born at Red River, Texas. "Texas Jack," as he was familiarly known in Washington, sat in Congress from 1903 to 1933 for the 15th District of Texas, an area as large as New York state. In his 25 years he made few speeches, but was known for his influence, wit, and caustic remarks. He was the favorite son of Texas in 1932 campaign, but he released the Texas delegation in favor of Roosevelt, which together with the California delegation controlled by McAdoo, insured the election of Roosevelt and secured for himself the vice-presidential nomination. Again in 1940 Garner was an avowed candidate, but brought out little strength. He retired to his Texas home, returned in the late days of the session of Congress, and to the inauguration, after which he went to his home in Uvalde, Texas. Garner began his public career as a cow-puncher, then was admitted to the bar in 1890, and soon became a bank owner and large holder of land. He began to serve as a county judge in 1893, and in the Texas legislature from 1898 until elected to the national House in 1902.

GASPARRI, PIETRO (1852–1934). Cardinal of the Roman Catholic Church and Papal Secretary of State. In 1864 he was sent to the Seminary at Nepi, and in 1870 to the Pontificial Seminary, after which he became secretary to Cardinal Mertel. From 1875 to 1879 he taught canon law at the College of the Propaganda, and later in Paris, 1879–1898. Then he was delegate to Peru, Bolivia, and Ecuador. In 1907 Gasparri became a cardinal. He completed in 1916 the immense task of codifying the canon law of the church. From 1914 to 1930 he was Secretary of State, and as such carried forward important diplomatic plans. In 1929 he signed for Pius XI the Lateran Treaty, by which an old dispute between the Vatican and Italy was settled and the Pope emerged from his voluntary imprisonment in the Vatican grounds. Cardinal Gasparri also attempted the codification of the laws of the eastern church, and sought to bring together the two great branches that had been separated for over 1500 years.

GAULLE, CHARLES ANDRE DE (1890–). French General. After graduating with high honors at St. Cyr in 1911, he entered the infantry, served in the World War, was twice wounded, cited three times for bravery, and spent over two years in the enemy concentration camp. Because of his advocacy of a highly mechanized French army, he found small favor among the older generals. In 1935 he urged the Chamber of Deputies to allow mechanization of at least 10 divisions. In his book, *France and the Army* (1938), he argued for modern methods of preparedness. Premier Reynaud made him a special assistant in charge of war department matters in the Cabinet. Then he was sent to England where he was conferring on common defenses when the final breakdown of France occurred. After the fall of France in 1940 the question arose as to whether all units and all colonies were included in the armistice. Charles de Gaulle, formerly an ally and subordinate of Marshal Pétain, then in England, resolved to organize a committee to carry on. After some delay and negotiation, the British agreed to back with money and supplies any Frenchmen who would fight to keep the colonies in Africa out of German hands. De Gaulle succeeded in mustering a considerable force to protect the African possessions and was hailed by Churchill as "the leader of all free Frenchmen."

GAYDA, VIRGINIO (1885–). Chief editorial writer of the *Giornale d'Italia* of Rome, and said to be spokesman of the Mussolini government. After a course in political economy in the University of Turin, Gayda spent some years as a correspondent in European capitals, mainly in the central area. He was in Russia at the end of the Czarist regime in 1917, and was instrumental in getting Italy to join the allied forces in World War I. Then he became writer from London and Paris for the Rome *Messaggio*, of which he was made editor, 1921–26. He was known to all newsmen as a friendly,

quiet, and learned man, and in no sense of the blustering type. He was close to Count Ciano and the Roman foreign office.

GEORGE VI (1895–). As second son of the late George V, George ascended the throne on Dec. 11, 1936, in succession to his oldest brother, Edward VIII, who abdicated the day before. Though never previously as popular as Edward, George was known as a fine and reliable young man, who had been carefully trained in the traditional naval service as a royal scion. Like his brother, he took up the course at the Royal Naval College at Osborne and Dartmouth, England, and then entered Trinity College, Cambridge. He was already in the service of the navy when the first World War broke out; participated in the Battle of Jutland in 1916; and rose to the rank of captain in 1925. In 1920 he was created Duke of York and three years later married Lady Elizabeth Bowes-Lyon, youngest daughter of the Earl of Strathmore. They had two daughters, Elizabeth Alexandra Mary and Margaret Rose. George VI began to reign in a very difficult period of English history, when confidence in the throne had been somewhat shaken, and when his popular brother had abdicated in his favor. He always had been of retiring disposition and suffered from hesitancy in his speech, which he later overcame in large part. As the second son of the reigning house, his main duties had been attending to various social and diplomatic functions to represent his father, while his older brother had been brought up with the idea of reigning. Yet George soon gained the confidence and respect of his people and the support of the chief ecclesiastical authorities.

GOEBBELS, JOSEF (1897–). German propagandist. One of Hitler's chief aides in building up the Nazi party in North Germany, though he did not join the group until 1926. In 1927 he began to edit *The Attack*, a chief German propaganda organ. Two years later, Goebbels began to control some of the sources of news, and Hitler made him chief minister of information in 1933 and in charge of Reich culture elsewhere. Thus he became responsible for radio, press, and public discussion wherever German influence was strong. He himself became a voluminous writer on various topics, after he obtained his doctorate at Heidelberg in 1920. Next to the Fuehrer, Goebbels dominated the thought of his countrymen.

GOERING, HERMAN W. (1893–). In his control over business and the means of production in Germany, this man has carried out the wishes of his chief, with whom he joined in the abortive Beer Hall Putsch in Munich in November, 1923. Goering was an ace in the first World War, and afterward, for two years, in civil aviation in Sweden. After Hitler's attempt to seize power from President von Hindenburg, Goering spent four years in Italy. In 1928 he entered the Reichstag, of which he became president in 1932. After 1933 he became, in turn, minister of air forces, interior, war, and police in Germany. Hitler gave him the title General of Infantry, and, in 1936, put him in charge of the so-called German four-year plan. Control of business was stiffened again in 1937. During the second World War, the power and influence of Goering assumed a wider scope, along with the domination of the neighbors of Germany.

HAILE SELASSIE (1891–). Name assumed by Ras Tafari Makonnen on becoming Emperor of Ethiopia (Abyssinia) in 1930. He was the great grandson of Haile Melekat, King of Shoa, and grand nephew of Emperor Menelik. At the age of seven he was sent to Europe to be educated, and at 14 he became governor of Garamollata, and later studied in the English school at Addis Ababa, Ethiopia. He became governor of Sidonia in 1909, and of Harrar in 1910. Two years later he married his cousin. After the death of Menelik in 1913, the country endured the misrule of his successor, Lij Yasu, for three years, when the new emperor was deposed, imprisoned, and finally was reported to have died as the Italians were beginning to overrun the land in 1935. Lij Yasu was the son of the second daughter of Menelik and of Ras Mikail, father-in-law of Haile Selassie. Zaudita, another daughter of Menelik, succeeded him as empress, with Ras Tafari as regent and King of Shoa,—"King of Kings of Ethiopia." On the death of Zaudita in 1930, Ras Tafari became Emperor Haile Selassie I. He led in many reforms, such as abolishing slavery, freedom of children of former slaves, and establishment of a responsible government. After the invasion by Italy, Haile Selassie took refuge in England. In 1941 he returned to Africa to help his former subjects in their attempts to throw off the Italian yoke.

HALDANE, JOHN B. S. (1892–). Writer on biology of interest to the common man. Haldane completed his course at Oxford before the first World War, in which he became a captain and was twice wounded; from 1919 to 1922 was reader at New College; then professor of biochemistry at Cambridge until 1933; and since 1933 a professor of genetics in London University. In *My Friend, Mr. Leaky*, he indulges in some fanciful accounts of a magician. *Science and Everyd Life* (1940) by this author tells his desire to present, in brief articles, some facts which "a student leaving a universi with an honors degree would not be expected to know Some of his other popular books are *Possible Worlds* (192 *Facts and Faith* (1934), *Heredity and Politics* (1938), a *Adventures of a Biologist* (1940). As early as 1935 Halda urged Britain to prepare gas masks, trenches, and other d fenses against the war which he said was inevitable.

HARKNESS, EDWARD S. (1874–1940). Financier a philanthropist, born in Cleveland, Ohio, the son of Steph V. and Anna M. (Richardson) Harkness. From his father a uncle, original partners of Rockefeller, he received legaci amounting to 96 million dollars. Through a desire to avo publicity and what might seem egotism, Mr. Harkness nev allowed a complete list of his benefactions to be published, b they have been estimated by others as not less than 100 milli dollars. He established a house system of dormitories Harvard; was a generous benefactor to Yale, from which was graduated in 1897; gave funds for medical services and library to Columbia; granted large sums to Phillips Exet and other preparatory schools. St. Andrews, Scotland, a Columbia honored him with the LL. D.

HAWKS, FRANK M. (1897–1938). Holder of many avi tion records and pioneer in improving plane constructio From 1929 to 1937 he held the chief records for transcon nental flight in the United States. From Los Angeles New York, his first record was 18 hrs. and 22 min., lackin one second, with two stops for gas. In 1929 his non-st flight was made in 19 hrs., 10 min., with return to Los Angel the next day in 17 hrs., 36 min. He flew from New York Detroit in 2 hrs., 41 min., an average of 255 miles an hou and from New York to Philadelphia in 20 minutes. Once breakfasted in London, flew to Rome for lunch, and aga had dinner in London in the evening. From 1932 to 193 he withdrew from aviation. One of his last records w Hartford to Miami in 4 hrs., 53 min., and back in 32 minut less. He was killed in a fall while testing an airplane designe for "safety and comfort."

HENDERSON, NEVILE M. (1882–). Statesma and author. "This is the first source book on the Secon World War," says H. V. Kaltenborn. "It will remain one the most important." Mr. Kaltenborn was speaking *Failure of a Mission*, in which Mr. Henderson gives a fran almost unimpassioned account of his efforts, as British Am bassador, to prevent the war with Germany. Between 19 and 1937, when he went to Berlin, he served in the diplomat service in Russia, Japan, Constantinople, Paris and th Argentine. His attempts "to labor for an honourable peace are told in his *Failure of a Mission*, a first form of which a peared in *Life* for March and April, 1940. The English *Bl Book* and the *White Paper* also outline vivid accounts of th last days of diplomacy to avert a second European conflic In the latter occurs a 12,000-word account of Hitler, h government, and German psychology in 1939.

HEPBURN, MITCHELL F. (1896–). Statesma and Premier of Ontario, Canada. After serving in the Can dian Bank of Commerce from 1913 to 1918, he became secr tary of the East Elgin United Farmers of Ontario, 1919–2 Meanwhile, he had taken up residence on his tract of 95 acres in that district. In the general election of 1936 he w chosen to represent the district of West Elgin in the House Commons in Canada, being the first Liberal to be sent fro that area in 30 years. Again in 1930 and 1934 he was r elected. In 1930 he became leader of the Liberal Party Ontario, and on July 10, 1934, became Premier of Ontari During the years that followed he was of great aid to th government of William Lyon Mackenzie King and the part in the dominion.

HILLQUIT, MORRIS (1869–1933). Hillquit was born i Riga, Latvia; came to America in 1886, and for a time worke in the garment industry and then turned to journalism. Aft a three-year law course, he was admitted to the bar in 189 and was the representative of labor in many controversie In 1920 he defended the Socialist members threatened wit expulsion from the New York Legislature. In 1917 and 193 he was a candidate for the mayorality of the City of Ne York. In 1924 he was active in the campaign of Senato Robert La Follette. For nearly 30 years he was a member the International Socialist Bureau. For years, Hillquit wa national chairman of the Socialist Party in the United State and largely responsible for the ideals and influence of th organization. Hillquit fought against the inroads of com munism in the Socialist Party.

HITLER, ADOLF (1889–). An Austrian, son of small customs officer at the frontier, who wanted his son t have a good education. Adolf chafed under the routine an discipline, said he was out of sympathy with Austrian ides and methods, and early expressed his ideas of pan-Germanism

His schooling was routine and his attainments there rather meagre. He worked as a carpenter for five years, and later indulged in painting both houses and pictures, it is said. Objecting to military service in Vienna, he left for Munich in 1912. He gained distinction in the first World War as a dispatch runner. After some years of agitation, and the making of his plans as shown in his book, he joined with others in a revolt at Munich in 1923, known now as the Munich Beer Hall Putsch. He had joined the Nazis in 1919, after listening to a speaker out of curiosity; but, by 1923, he was flaming with zeal for what was called the National Socialistic German Labor Party.

After the revolutionary attempt at Munich, Hitler was condemned to serve five years in prison, but he was released after a year. Gradually gaining power, and cleverly appealing to the wide-spread feeling that the World War settlements had done the Germans great harm, Hitler became more and more of a national figure. In 1932 he opposed von Hindenburg for the presidency, and his national party became the largest in Germany. Hindenburg invited Hitler to form a ministry under certain limitations, but the attempt failed at the time. In 1933, however, Hitler displaced von Schleicher as president, and later proclaimed himself Fuehrer or Leader, assuming dictatorial powers. The government was more and more concentrated, and preparations for the great conflict hastened at full speed. Hitler gained at once the reputation of being a ruthless, clever, and unreliable statesman. He made promises and announced peaceful aims, all apparently (as the world found out later) conditions on other men and other nations giving way without a struggle to national and personal ambitions of the Fuehrer. For subsequent history of Hitler, see the story of the second World War in other parts of the *New Century Book of Facts.*

HOOVER, J. EDGAR (1895–). As director of the Federal Bureau of Investigation since 1924, Mr. Hoover won both praise and blame. General Hugh Johnson declared that he did more than anyone else "for law enforcement," "in this or any other country." Senator Norris asserted, however, that the methods of the FBI "Constitute a serious danger and they ought to be corrected and corrected now." He was born and educated in the national capital, where he was a model student and valedictorian of his class. His chief activities that have won most comment were his stiffening of investigations of all public enemies from racketeers to foreign agents. After arresting ten persons in Detroit for soliciting volunteers to the Spanish Loyalist army, the accused were released when Attorney Jackson quashed the charges against them. In the investigation of the FBI that followed, the government gave the department agents a clean bill. Later it was claimed that the Dies Committee was interfering with the success of the FBI and Department of Justice efforts to get at subversive agents in America. An agreement of the FBI and the Committee for more energetic cooperation was then formulated.

HOPKINS, HARRY L. (1890–). Hopkins was born in Sioux City, Iowa, the son of a harness maker, who moved to Grinnell where the son gained honors and popularity in Grinnell College, from which he was graduated in 1912. He then adopted the profession of a social worker in New York. From 1915 to 1917 he gave out widows' pensions for the Board of Child Welfare. Refused military service, during the World War he acted as director of the Southern Division of the Red Cross at New Orleans. Later he organized for Governor Roosevelt a system for caring for temporary relief in New York State. These two men formed a liking for each other on first meeting in New York during the Smith campaign in 1928, and when Roosevelt asked Hopkins to head the national emergency relief in 1933, he carried some of his plans to Washington. He is credited with several of the relief plans and agencies of spending nature. From May 20, 1933 to July 1, 1938, he disbursed over eight billions of dollars in various projects and relief activities. No man in America ever before handled as much money for such a purpose in so short a time. In 1935 he was put in charge of the WPA and later became Secretary of Commerce. Ill health forced him to resign in August of 1940, although he continued to reside at the White House for some time. In January, 1941, President Roosevelt appointed this personal friend a special envoy to London.

HOPPER, W. De WOLF (1858–1935). This popular American actor first appeared on the stage in *Our Boys* in 1879. Next he made Pittacus Green famous as acted by him in *Hazel Kirke* for the Madison Square Opera Company in New York. In 1891 he took up one of his best parts, as the Regent of Siam. He appeared successively in the Sousa operas, with Weber and Fields, as star in his own companies, in various Gilbert and Sullivan operas, and alone in recitals. In 1888 he first recited the humorous poem, *Casey at the Bat,* in Wallack's Theatre, New York, a piece which he estimated late in life he had spoken not less than 10,000 times. Some of Hopper's famous parts were in *Mr. Pickwick; Pinafore,* revived at the Casion, New York, in 1911, when he played as Dick Deadeye; as Reginald Bunthorne in *Patience;* Edward in *Pirates of Penzance;* and Ko-Ko in *The Mikado.* Hopper was also a favorite in *The Student Prince* and *The Yeoman of the Guard.* In 1933 he played in a revival of *Uncle Tom's Cabin.* His wife, Edna Wallace Hopper, also gained fame on the stage in the Frohman, Lew Fields, De Wolf Hopper and other theatrical and musical companies.

HORE-BELISHA, LESLIE ( ). He received most of his education at Oxford, where he was president of the Oxford Union, or students debating society. Entering Parliament in 1923, he rose to become Minister of Transport, 1934–37, and Secretary of State for War until 1940. He was a strong advocate of a mechanized artillery and infantry of England, and of the organization of new units, and the transfer of older or ineffective officials. Though he met with stiff opposition at times, Hore-Belisha succeeded in reorganizing the air and coast defenses, and in forming groups of territorials into anti-aircraft and other guards. Many volunteers were also gathered for new and expanded preparations for war.

HULL, CORDELL (1871–). American statesman, born in Tennessee, studied at Lebanon, Ohio, and at Cumberland University Law School, and set up in practice in his native state in 1891. During the Spanish-American war he served in the Fourth Tennessee Infantry as captain. After four years in the Legislature, he was in the federal House of Representatives from 1907 to 1921 and 1923 to 1931, when he entered the Senate for the term, 1931–37. He resigned to enter the Cabinet on March 4, 1933. Hull served on various national and international committees, including the important Economic Conference in London in 1933, and the Seventh Conference of American States at Montevideo. In his negotiations with other countries, he acquired a reputation for caution and conservative measures likely to have a permanent effect. In 1941 before a congressional committee he opposed granting unlimited power to the chief executive. Hull is the author of the income tax system of 1913, with its revisions in 1916 and also of the inheritance tax of 1917.

HYDE, DOUGLAS (1860–). President of Eire, or the Irish Free State. Educated at Trinity College in Dublin, from which he received his LL. D. in 1887. In 1891 he taught in the University of New Brunswick in Canada. Hyde became known as the greatest living scholar of Gaelic and the leader in many movements for appreciation of the language and literature of Ireland. In 1909 he became professor of Irish in the University of Ireland. He is the author of many books, including plays, songs, translations from the old Irish, criticisms, and stories. His *Literary History of Ireland* is a standard work. In 1925 he became an Irish senator, and in 1938, when a new president of Eire was sought, they chose him as being the man least influenced by the politics of the last few years.

ICKES, HAROLD L. (1874–). Militant reformer and Secretary of the Interior under Franklin D. Roosevelt. Ickes was born in Frankstown, Pa., became an A. B. at Chicago in 1897 and then entered newspaper work, after which he engaged in many Chicago and Illinois campaigns for what he considered progressive ideas. He first attracted attention outside of Chicago, his adopted city, in the Progressive Campaign of 1912, when he was an ardent member of the third party under the elder Roosevelt. In 1924 he acted as the manager of the campaign for Hiram Johnson. Though a forceful thinker and interesting speaker, Ickes diminished his own influence through an intolerant and harsh way of speaking of individuals and their ideas.

INONU, ISMET (1880–). As Premier of Turkey for 13 of the 19 years that Kemel Ataturk was in power, Ismet was well fitted to succeed to the presidency in November, 1938. During the intervening years he was the force behind the administration, and Kemel once said, "He is my conscience; he criticizes me and tells me what to do." Indeed, the Premier is now given large credit for abolishing the Caliphate, in breaking up the sectarian schools, and in forcing the Turks to abandon their fezes in favor of English hats. He came to be known as a quiet man, fond of his family, but a leader of iron resolution, with none of the flare for high life that weakened Kemel himself. Ismet Inonu was chief of staff against the Greeks in Anatolia, under-secretary of military affairs in the World War, and head of the delegation to the Lausanne Conference. He did much to modernize the Turkish army and to get the people to turn their eyes westward to a different civilization and culture.

IRONSIDE, SIR EDMUND (1880–). Commander of the British Territorial Army, and made chief ot the Imperial Staff in 1939. The son of a Scotch surgeon in the British forces, Ironside studied at the Woolwich military academy in England. He rose rapidly to become a captain in 1908, a major in 1914, a colonel in 1918, and also in 1918, at the age of 38, a major general, one of the youngest men ever to attain such a rank. After service in the army in the Boer War, he

remained in South Africa for 13 years. In World War I he was the first uniformed British officer to serve in France, and was mentioned seven times in the dispatches. He commanded part of the allied forces in 1918–19; served the Greeks and Turks in 1920; commanded in Mesopotamia in 1921; in India in 1933–36; and became commander of British forces in the east.

JACKSON, ROBERT H. (1892–). Before he entered the service of the government in 1934, Mr. Jackson spent nearly all his life in Jamestown, New York, where he was counsel for corporations and local interests that were struggling against some limitation or unfair competition. He was a student in the Albany Law School, and entered law at 21. In 1929 he helped consolidate three banks and became director of the new Bank of Jamestown. He first entered the Bureau of Internal Revenue as general counsel, where he was pronounced one of Uncle Sam's "most zealous tax collectors." As assistant tax attorney general in 1936 he had charge of important litigation growing out of investigations of trusts. In the term of the Supreme Court that ended in June, 1939, Jackson argued 24 cases, and lost but three. In 1940, upon Frank Murphy's appointment to the Supreme Court, Jackson was made Attorney General.

JOHNSON, HUGH S. (1882–). General, radio commentator and columnist, born at Fort Scott, Kansas. A graduate of West Point in 1903, he later took courses in Oklahoma Teachers College, and the University of California (Doctorate in Law, 1916). He rose from the rank of second lieutenant, 1903, to brigadier general in 1918. The following year he resigned from military service and became vice president and general counsel of the Moline Plow Company and Moline Implement Company, which he organized, 1919–29; and then associated himself with Bernard M. Baruch in New York City. In military circles, Johnson was best known as the organizer of the plan for selective draft in 1917 and also of the purchasing, storing, and traffic divisions in use from 1918 to the end of the first World War. He was awarded the Distinguished Service Medal for "work on the selective draft." President Roosevelt put him in charge of the NRA in June, 1933, but Johnson later withdrew and became one of the severest critics of administration plans and methods. Among his numerous military assignments were to the Philippines, 1907–09; Yosemite and Sequoia National Parks, 1910–11; judge advocate to General J. J. Pershing on the Mexican Expedition, 1916; assistant to law officer of the Bureau of Insular Affairs, 1916–17; general staff, 1918; commander of the Eighth Division, 1918 to Jan. 1, 1919.

JONES, JESSE H. (1874–). On recommendation of vice-president elect, Garner, President Hoover made Jesse Jones the director of the new Reconstruction Finance Corporation in 1932. Under his direction this was known as a most efficient government agency. Out of a life of hardship and struggle, with only moderate schooling, he had worked his way up to be a capitalist of note. One of his mottoes was "the greatest disservice you can do a man is to lend him money he can't repay." Billions have been lent in sums ranging from millions to the railroads at a time to $200 to a fisherman on his small craft, always "on the best terms possible to the government and to the borrower." In July, 1939, Jones became Federal Loan administrator, and in August, 1940, was called to the Cabinet to succeed Harry Hopkins as Secretary of Commerce. Before the first World War, Jones had established a lucrative lumber business in Houston, Texas, and at a later time did considerable building in New York City. He served for 18 months as director general of relief of the Red Cross from the United States in France, and was in charge of setting up canteens and recreation centers for the American soldiers. From 1924 to 1928 he directed the finances of the Democratic National Committee. In Washington he succeeded in gaining the friendship of men of all shades of political and economic beliefs.

JUNKERS, HUGO (1859–1935). Famous maker of airplanes, especially of metal construction. He was a graduate of Berlin in technology and also studied in Aix-la-Chapelle, where he later lectured for 14 years. He was active in the making of gasolines from 1899 on. At one time, one-third of all planes were equipped with something made in his immense factories. During the World War his planes made some spectacular flights. After 1933 his factories were newly organized with government control and subsidies. In 1926 his aircraft carried 110,000 passengers and 1,513 tons of mail, a record for that early day in aviation.

KAGAWA, TOYOHIKO (1888–). Christian social leader of Japan. After a complete education in his own land, he continued his studies at Princeton University. From 1908 to 1923 he lived and toiled in the slums of Kobe. He was instrumental in organizing the workers and the farmers of Japan into movements to better their conditions. In 1924 he founded the industrial Y. M. C. A. of Japan, and five years later became a social worker in Tokio. Kagawa has travelled and spoken in most civilized lands, being well known in America. During the war with China, he was put under restraint by the Japanese. Among his many books, some are *A Grain of Wheat* which enjoyed an enormous sale, *Love the Law of Life, Study of the Psychology of the Poor*, and *Songs from the Slums*.

KETTERING, CHARLES F. (1876–). The first task of this noted inventor was to develop a motor that would run cash registers. His early life was a struggle to get an education despite hardships of poverty and poor eyesight. Much of his inspiration came from a country schoolmaster, who in his way was a scientist, from a friend who showed him that many things are related in this world, and from his own courage and determination to do things. After finishing his course at Ohio State University at 27, Kettering went to Dayton. Some of the inventions in which he had a greater or lesser share are Duco paints for cars, Delco lighting, the Diesel engine, ventilation for crankcases of motors, artificial refrigeration, and better gasolines. To him research is a science, not a plaything, and he believes great inventions are yet to be made. In connection with General Motors, he early centered his attention on labor-saving devices, increased production, and ways to put more men into employment.

KIERAN, JOHN (1892–). Best known as the man with an amazing store of knowledge for hearers of the National Broadcasting Company's *Information Please*. He was the eldest son of Dr. James M. Kieran, who was professor and later president of Hunter College, New York City. After studying at the College of the City of New York, he obtained a degree at Fordham in 1912. Then he engaged in farming in Dutchess County for a year and afterward turned to various occupations. In 1915 he began to write in the sports department of the *New York Times*. He was one of a company of volunteer engineers who served during two years of the World War. After several years with the *Herald-Tribune* and the Hearst publications, he again joined the *Times* in 1927, and wrote the first signed daily column of events in sports, which he called "Sports of the Times." Kieran is interested as an amateur in music, art, natural history, chemistry, and literature. Once he remarked "Whenever a new book comes out, I read two old ones."

KNOX, FRANK (1874–). A Bostonian by birth, Knox was educated in Michigan at Alma College, and then was connected with the Grand Rapids *Herald* (1898–1900), with the Sault Ste. Marie *News* as publisher (1910–12), with the Manchester (N. H.) *Union* consolidated with the *Leader* under him, and later with the Hearst papers in Boston until 1931. With Theodore T. Ellis he bought the control of the Chicago *News*, becoming publisher in 1931. War service and politics meanwhile engaged his attention. He was with Theodore Roosevelt in Cuba with the Rough Riders, and became captain and major in the World War with the 78th Division. He was chairman of the Republican State Central Committee and later of the delegation from New Hampshire at the Convention that nominated Harding in 1920. President Taft made him a member of the Board of Indian Commissioners, and Hoover of the Committee to Combat Hoarding, 1932. As vice presidential candidate in 1936, Knox toured the country making speeches. No little stir was caused when President Roosevelt, in 1940, chose Knox to be his Secretary of Navy. For some time, however, Knox had been known as an advocate of a strong military policy for the United States.

KOUSSEVITZKY, SERGE (1874–). Conductor and musician; a champion of recent music, with a rare discrimination for what will live. Men like Sibelius, Honegger, and Walton have been introduced by him to American audiences. Before he gave up trying to live in the new Russia, he was leader of an orchestra of his own, supported by his wife's people, who were wealthy merchants. One of his tours down the Volga in a chartered boat took him and his men 2,300 miles to people who never had heard good music before. He and his wife founded a publishing firm for musical works. With the Revolution, his orchestra and firm were taken over by the state although he was made leader of the Russian Orchestra. In 1920, with little property left, he left his native land, and until his call to Boston in 1924 conducted in various musical centers. Tanglewood, a fine estate in the Berkshires, has been given to the Boston Symphony Orchestra, endowed by the Rockefeller Foundation, and put into service as the summer home of the Symphony. There the Berkshire Music School was started in 1940.

LA GUARDIA, FIORELLO H. (1882–). Politician born in New York City. Elected mayor of New York in 1933 and reelected in 1937. He served in European consulates for the United States from 1901 to 1906, and then as interpreter at Ellis Immigration Headquarters until 1910. Began law practice in 1910 and was a member of the House of Representatives from 1917 to 1921 and 1923 to 1933, after serving two years as deputy attorney general of New York. In the World War he rose to the rank of major in the air corps and for

bravery with a bombing squad was made a Knight Commander of Italy. His administration was notable for economy, reform, and popular appeal. He was first elected as a Fusion candidate. In 1940 he was made chairman of an American delegation to promote cooperation with Canada in regard to certain war preparations.

LAWRENCE, ERNEST O. (1901–). Scientist, born in North Dakota, the son of a normal school teacher. His education was received at St. Olaf College, University of South Dakota, and at Minnesota, Chicago, and Yale, where he obtained his Ph. D. in 1925. As winner of the Nobel Prize in science in 1939 for his building of the cyclotron, Dr. Lawrence sprang into international fame. His invention is a gigantic "Rube Goldberg contraption" of 220 tons for the purpose of smashing atoms. At his laboratory on the campus of the University of California, Lawrence and his staff, through this machine, have succeeded in revealing many secrets of nature. They have artificially created many radio-active substances, such as common salt, and may even have found ways of building up substances like the precious metals. Their methods are being followed in many laboratories all over the world. Through a grant by the Rockefeller Foundation, a new cyclotron of 4,900 tons weight promises to reveal secrets of the composition of substances as yet undreamed of by man.

LEAHY, WILLIAM D. (1875–). American admiral, appointed Ambassador to the Vichy Government of France in 1941 by President Roosevelt. This Iowan was graduated from the Naval Academy in 1897 and rose through the various ranks to become captain in 1918 and rear admiral in 1930. Meanwhile he served in the Spanish-American War, the Philippine Insurrection, Boxer, Nicaraguan, and Haitian campaigns, and as a commander in the World War. Awarded various metals. He commanded the destroyers scouting force, 1931–33; was chief of the Bureau of Navigation, 1933–35; then vice admiral of the Battle Force; and admiral 1936–37, until retirement, after service as Chief of Operations.

LEWIS, MARY SYBIL (1900–). This gifted operatic-singer was born and educated in Hot Springs, Ark. After three years in the Ziegfield Follies, she made her operatic début in Vienna in 1923, with a rôle in *Faust*. Then she appeared at Monte Carlo, London and Paris, returning to the United States in 1925 for an engagement at Carnegie Hall, New York, and three months later, Jan. 1936, at the Metropolitan Opera House as Mimi in *La Bohême*. Some of her principal parts have been those of Juliet, Marguerite, Gilda, Lauretta, Manon, Nedda and Antonia. In 1927 she married Franz Bohnen, and in 1931 Robert L. Hague.

LIN YUTANG (1895–). Author, born of a second-generation Chinese Christian family. He was educated in the mission schools and in St. John's College in Shanghai, at Harvard, and in Germany, where he took his Ph. D. at Leipzig. He then became a professor in Peking for three years, joined a revolutionary movement, but soon concluded he was "better at minding my own business than that of others." This author of *The Importance of Living* (1937) succeeds best in bringing to the western world the flavor and wisdom of China. However, he studied ideas and men a long time before he ventured to write down his conclusions of them. Lin speaks to the world of the China of today in *My Country and My People* (1936); outlines the history of the fight for freedom in *History of the Press and Public Opinion in China* (1937); and in *Moment in Peking* (1939) tells the story of an upper-class family in the years following the Boxers in 1900, down to the flight of China inland in 1938.

LITVINOFF, MAXIM M. (1876–). Commissar for Foreign Affairs of the Russian government, who was born in Bielstock. For interest in revolutionary activities, he was exiled in 1903, before the first World War joined the newly formed Bolshevik party in Switzerland, and for some time lived in England. He returned to Russia in an exchange of political prisoners and then became one of Lenin's chief executives. Litvinoff was an extremely adroit and capable diplomatist, both at home and abroad, taking an active part in debates in the League of Nations for disarmament. He succeeded in avoiding the internal strife which at times divided the Soviets into two hostile camps. In 1933 he spent some time in Washington just before the U. S. government recognized the Russian regime, for which he had zealously worked for a number of years. In 1939, during the war with Finland, Litvinoff was recalled from the front and made chief of the Foreign Information Bureau of the Soviet Party, but in 1941, was relieved by Stalin of all posts in the Soviet Union Council.

MAGINOT, ANDRÉ (1877–1932). At the time of his death French Minister of War, in whose honor the defenses on the eastern borders of France were named. Maginot was always a strong nationalist and leader in efforts to keep his country prepared. He entered politics in 1910, became Deputy of the Department of the Meuse, and was one of the chief supporters of Aristide Briand. At the outbreak of the World War, Maginot refused a commission, enlisted as a private, returned badly wounded, and again entered Parliament. He was a stern critic of the conduct of the war in 1917. He served in various government posts,—as Minister of Colonies in the cabinet of Ribot, and as Minister of Pensions during several government administrations. In 1922 he introduced the bill providing for the creation of an air ministry in France. In 1924 and 1927 he was a candidate for the presidency of the Chamber of Deputies. He was Minister of Colonies, and also of War, during the period of frequent changes in the government of France.

MANLY, JOHN M. (1865–1940). Author and teacher, born and educated in the south, taught at Brown University for seven years, and from 1898 to 1933 was chairman of the English department in the University of Chicago. Besides a great deal of editing and incidental scholarly writing, Manly stimulated interest in early drama with his *Pre-Shakesperian Drama* (1897); in the survey of English literature with his *English Prose and Poetry* (1907, 1909); and his short accounts and bibliographies of contemporary literature in 1919 and later. Though now known best as a teacher and authority on early English literature, Professor Manly in the last years of his life completed, in eight volumes, the restoration of the text of Chaucer's *Canterbury Tales*, a prodigious task on which his fame in the future will rest. For ten years he, together with a staff of students and assistants, carried on research in the manuscripts of Chaucer and at last completed what will doubtless become the standard text.

MANN, THOMAS B. (1875–). German author, born at Lubeck. He began his writing as editor of a school paper in Germany at 15, and later became editor of the famous *Simplicissimus* at Munich. Mann introduced a different type of novel with *Buddenbrooks* (1901), a biography of a whole family, showing a gradual decline. *Magic Mountain* (1924) is thought by many to be his best of many works. Only about 1,000 copies were sold in the first year, but a later edition ran to over two million. It is the story of contemporary life in a sanitarium in Switzerland, where Mann was then living. Mann won the Nobel Prize for literature in 1929. In 1933 he made a speech in which he criticized the Nazi theories and methods, and his friends warned him not to return from Switzerland to Germany. Later Mann came to the United States and made his permanent home in Rhode Island. He holds a Ph. D. from the University of Bonn. Other famous books of his are *Mario and the Magician* (1929) and *Joseph in Egypt* (1937). Mann also did much other writing and some speaking on behalf of democratic ideals after he came to America.

MANNERHEIM, CARL G. E. (1867–). Finnish national hero who declined a crown and could have been a dictator. From 1919 on he was the builder and defender of the defenses of Finland. Mannerheim came of Swedish ancestors who had lived in Finland for some time. He was influerntial at the court of Nicholas of Russia, having gained great distinction as an officer in the war against Japan. During World War I he served at various points and became a lieutenant general, with several decorations and national honors. When Finland at last broke from Russia, he resigned his command, left for Finland, and there soon became regent and the most powerful man in a country that was looking for a king. Mannerheim, instead of accepting the chance as urged by friends, signed a democratic constitution for a time and then resigned as regent. His countrymen gave him a pension of $150,000. He retired to his estate, was known as the Liberator, refused to meddle in politics, and came forth again to aid his people in their war with Russia in 1939 and 1940. As one historian remarked, Baron Mannerheim could have been what neither Hitler nor Mussolini can boast of—a real king.

MARSHALL, GEORGE C. (1880–). General Marshall became Chief of Staff of the U. S. Army on Sept. 1, 1939, a young man to hold this position, and the first since Leonard Wood to attain this rank without being a graduate of West Point. A native of Uniontown, Pa., he received his training at the Virginia Military Institute, 1897–1901; as honor graduate in the U. S. Infantry-Cavalry School, 1907; and Army Staff College, 1908. Commanded second infantry, 1901, and rose to rank of brigadier general in 1936. Some of his important assignments were in the Philippines, 1902–03, 1913–16; instructor in Army War College, 1908–10; general staff of First Division, chief of operations in First Army, and chief of staff of the Eighth Army Corps in the World War; 1918–24, aide to General J. J. Pershing; 1924–27 in China; assistant commander of the Infantry School, 1927–32. From 1933 to 1936, General Marshall was senior officer of the Illinois National Guard; in 1936 he took command of the Fifth Brigade. He was chosen to be Chief of Staff in line with the government policy of selecting younger men for important posts.

MARTINELLI, GIOVANNI (1885–). Celebrated tenor of the Metropolitan and other opera companies in the United

States, with more than 50 rôles in his repertoire. He was born near Venice, Italy, and was educated, married and introduced to the opera in Italy. He came to the United States in 1913, three years after his European début. He sang with opera companies in San Francisco, Chicago, and St. Louis, but mainly with the Metropolitan in New York. Noted for the strength and purity of tone and ability in acting.

MATSUOKA, YOSUKE (1880–). Matsuoka was born of the poor class in Japan and was partly educated in Portland, Oregon, by a family that befriended him after he landed in America in 1893. He was taught the Christian faith, but declares that he is a "Matsuoka Christian." After a high school course in Oakland, California, he entered the Law School of the University of Oregon, from which he was graduated in 1900. It would seem that he learned much of business methods in the United States, for one of his most important positions has been as executive of the South Manchurian Railway, of which he became president in 1935, after having served the same organization in various capacities from 1920 to 1930. In 1904 he became vice-consul at Shanghai, later chief of the foreign section of Kewantung Concession, consul at Mukden, and one of the Japanese secretaries at Washington. He went to the Versailles Conference with the Japanese delegation, and spoke ably for Japan in 1932 before the League of Nations, withdrawing with the Japanese when their demands were not met. Matsuoka is an advocate of direct action in Japan; he has succeeded largely in abolishing the system of political parties, from which efficiency might as well be expected, he declared, as for "a pig to fly." After this man was made foreign minister of Japan in 1940, it was predicted that he might be on the way to become the Hitler of the Orient. He has frequently spoken of the objective of his country as a "determination to fulfil her mission in Asia." Just what this mission is conceived to be was not explained. In March, 1941, the announcement was made that Matsuoka was on the way to confer with Japan's axis partners in Europe. A few days before, the conflict between French Indo-China and Thailand (Siam) had been settled with Japan acting as intermediary. Siam obtained important concessions of territory.

MELCHOIR, LAURITZ (1890–). Operatic singer, a native of Denmark, Melchior was once a member of the Royal Guard. He was decorated by various European countries, being a Knight of Dannebrog of Denmark and a member of the Legion of Honor of France. As a baritone he won his first great fame in Copenhagen in 1913 and then in various capitals of Europe and South America. He sang in Covent Garden, London, for years; at the Wagner festivals at Beyruth; and from 1926 on at the Metropolitan Opera in New York.

MENUHIN, YEHUDI (1917–). While still a child he was acknowledged as one of the world's most finished violinists. He was born in the City of New York, the son of a wandering Russian Jew, who had lived in Palestine and later in San Francisco. When they gave Yehudi a toy violin at three, he threw it on the floor because it sounded so harsh. Then they bought him a real instrument. At four he took his first lesson; at seven became soloist for the San Francisco Orchestra; at eight won great applause at the Manhattan Opera House in New York; and at ten amazed an audience at Carnegie Hall. He was a regular performer with the Berlin Orchestra at eleven. After one concert a great man exclaimed, "Yehudi, today you have once again proved there is a God in Heaven." That man was Albert Einstein.

He was put under training and discipline by George Enesco, the celebrated teacher. After several years of training, long hours of practice, and much criticism, Yehudi made his world tour in 1935, giving 110 performances in all. He retired for two years so that his mother "could have her boy back again." In 1937 he began his career as an adult performer. In 1940 he gave a series of concerts in Australia for the benefit of war sufferers. No artist has worked harder and with better results. Menuhin asked Toscanini why he did not criticize him and tell him when he played badly. The great conductor replied, "It's always perfect, Yehudi." Enesco still guides him, and of late the artist has refused to appear more than 50 times in a season, until his art is better established. Menuhin excels in freedom and perfection of tones. He has never played stunts or difficult pieces just to show off his technical skill.

METAXAS, JOHN (1871–1941). Grecian general and statesman, who was the one man able to bring order out of troubled conditions in Greece, even by methods imitated from Hitler and Mussolini. He was born in Cephalonia of a military line of ancestors. After training in the Greek Military School, he fought against the Turks in 1897, and two years later entered the German school at Potsdam for a four-year course in strategy. From 1903 to 1912 he was in the army, and again fought the Turks in 1912, when he was assistant chief of staff. For having advised King Constantine to ally with Germany, Metaxas was exiled from 1917 to 1921. Then he supported King George II and in 1926 became Minister of Communications in a union cabinet. In 1934 he was blocked at the poll in trying for power. During the second regime of George I he became Vice-premier and War Minister in 1935, and Pre mier in 1936. Four months later, when a general strike threat ened, Metaxas announced himself as dictator, "a sort o modern monk" with nothing but the good of Greece to live fo His methods were rather ruthless, but they appeared effective Metaxas continued to be friendly to the English allies, kep his plans to himself, and at last in 1940, when Italy attacke Greece, proved that his preparations had been thorough an sufficient to defend his country. He died suddenly in January 1941.

MITCHELL, MARGARET ( ). This author o *Gone with the Wind*, after a course in Washington Seminary Atlanta, Georgia, her birthplace, and in Smith College, be came a reporter and special writer for the Atlanta Journal i 1922. Three years later she married John R. Marsh of Atlanta In 1926 she began to write a novel, which ten years later wa acquired by a representative of the Macmillan Company o New York and soon published. Few books have been so suc cessful in both original text and screen version. Her worl sold a million copies in six months, and half that many mor in the next six; it won the Pulitzer prize for 1936, was chose by the Book of the Month Club and by similar groups i England and Germany. By 1940, *Gone with the Wind* ap peared in 16 foreign languages and in Braille for the blind As a portrayal of the old South, it was pleasing to all section and persons of all ranks and creeds. The motion pictur version, taking four hours to show, was produced after elabo rate preparations and the most scrupulous attention to settin and all plans in order to make it true to the period represented It was partly filmed before the leading lady, as Scarlet O'Hara, was found in an English actress, Vivien Leigh. Mis Mitchell's family background is that of lawyers, historians and good old Methodist preachers. In 1939 she was awarde an honorary A. M. degree by Smith College.

MOLATOV, VYACHESLOV (1890–). After the Finn ish war, he was named successor to Litvinof as premier o Russia and also foreign minister under Joseph Stalin. Thi son of a poor clerk named Sciabin assumed the name Molato in 1906. While he was a student, a sentence of two years i prison against him was suspended on condition that he leav his native town. In 1911, during a course at the Petrogra Polytechnic Institute, he did some writing for the organ calle *Pravda*, but in 1913 had to leave the city by official orde Three years later Molatov was sent to Siberia, from whic region he escaped and made his way to London. There h belonged for a time to the circle with Lenin and Stalin. Unti the return of Lenin to Russia from abroad, Molatov acted a secretary of the Bolshevik movement. For many years h was the confident and aid to Stalin, who at last saw that h had a prominent position in his administration.

MONROE, HARRIET (1860–1936). Poet, born in Chicag and educated in Washington, D. C., and leader in the poeti movements of America for a generation. She was commis sioned to write the official *Columbian Ode* for the Chicag Exposition in 1893. The New York *World* paid $5,000 as penalty for publishing this before it was delivered. In 191 she founded the Poetry Magazine, which later was perma nently endowed by contributions of over 100 people, and sinc has been a great force in encouraging young authors. Amon her own volumes were *The Passing Show*, verse plays; *Yo and I*, poems; and *Poets and their Art*, a book of criticism. I 1936 she was called to South America for a literary celebra tion, and died in Peru while returning.

MURPHY, FRANK (1893–). Inheriting his ability a a speaker from his father, a quick-witted Irish attorney, h entered public life in 1912 speaking for Woodrow Wilson in th campaign. In 1914 he obtained a law degree from Michigan and later studied in London and Dublin. For a time he earne his way in America as a law clerk at $13 a week and taugh Hungarians English at $2.00 per lesson. In the World Wa he became a captain of infantry in France and later in Ger many with the Army of Occupation. He was chief assistan U. S. Attorney for the eastern district of Michigan, 1920–23 and after acting as city judge and instructor in law at Detroi University he became Mayor of Detroit, 1930–33. The ability shown in Detroit in the midst of unusually severe condition gained him considerable fame, but he resigned his position a Mayor when President Roosevelt asked him to become gov ernor of the Philippines. He defeated Governor F. D. Fitz gerald of Michigan in 1936, but was defeated by Fitzgerald i 1938. He became Solicitor General of the United States i 1939 and then Attorney-General. In 1940 he was advance to the Supreme Court.

MURRAY, PHILIP (1886–). Labor leader, born i Scotland, who with his family settled in western Pennsylvani in 1902, obtaining a job in the coal mines. He was mainly self educated. At the national meeting of the Congress of Indus trial Organizations held in November, 1940, Murray wa

elected president. For thirty-six years he had been quietly working among the miners of western Pennsylvania as an assistant and friend of John L. Lewis. When Lewis realized that he could not unify the discordant left and right wings of the C. I. O., he was willing that Murray should succeed him. Murray had tried, for some time, to reconcile the two groups—the left-wing favoring Lewis, and the clothing workers who opposed him. Before he would become president of the C. I. O., he demanded and secured a resolution condemning communism, fascism, and nazism in the ranks of labor. In his inaugural address before the C. I. O., Murray mentioned as one objective the unionizing of certain large industrial plants. In 1916 he became head of the Pittsburgh area of the United Mine Workers of America, and in 1919, Vice-President of the national organization under Lewis. President Wilson made him a member of the War Labor Board, and he enjoyed the confidence of President Roosevelt.

PACK, CHARLES L. (1857–1937). Long before President Theodore Roosevelt appointed him a member of the National Conservation Commission, Mr. Pack was widely known as a zealous advocate of better methods of caring for our timber. During the first World War, he led a movement for planning gardens on vacant lots and waste places; over 3,000,000 were developed to produce new supplies worth half a billion dollars. In this and other movements, several small books of his attained enormous sales, such as the *War Garden Primer, School Book of Forestry, Forestry Primer* (1926), and *Forests and Mankind.* After the World War he helped plan the reforestation of France, England, and Italy. He was also the founder of the Cleveland, Ohio, Trust Company, mayor of the city, and leader in various civic movements.

PIUS XII (1876–). Cardinal Eugene Pacelli ascended the papal throne in 1939. He received his early training in the Gregorian University and Roman Seminary, becoming a priest at 23. In succession he was attached to the department of state, a professor, secretary of Extraordinary Ecclesiastical Affairs, and in 1917 Archbishop of Sardes. He was made a cardinal in 1929, and was papal secretary of state, in succession to Gasparri, from 1930 until his elevation to the papal throne. Cardinal Pacelli was known for his accurate and wide knowledge of world diplomacy. He has visited various countries and has represented the church at various gatherings at home and abroad.

PONS, LILY (1904–). This gifted singer was born and educated at Cannes, France, where she won her first ovations. She has always been noted for purity and clearness of tone. In 1928 she made her first appearance in grand opera as Lakmé; and three years later, her first appearance in New York as Lucia at the Metropolitan. Gilda and Rosina are other favorite rôles, but she has appeared on the air and in many different musical settings. In 1923 she married August Mesritz, whom she divorced ten years later, and in 1938 she married Andre Kostalanetz, celebrated orchestra conductor.

POST, WILEY (1900–1935). He gave up farming in his native state of Texas to take up the drilling of oil wells in Oklahoma, and through an accident at a well, lost one eye. With the $2,000 received in insurance, he bought a second-hand plane and became an aviator. In 1930 Post won the Chicago-Los Angeles Air Derby in a time of 9 hrs., 9 mins. and 4 secs. He was always trying for new records. He sought four times to beat the record of Frank Hawks and others from Los Angeles to New York; and on one flight said he attained a ceiling of 49,000 feet, but failure of his baragraph made this an unofficial record. In 1931 he and Harold Gatty completed a flight around the world in 8 days, 15 hrs., and 51 mins. elapsed time. Two years later, and alone, he lowered this record to 7 days, 18 hrs., and 49 mins. This was the first solo flight around the world, and the plane in which he made this flight, the *Winnie Mae,* is now in the Smithsonian Institute in Washington. In 1935 Post, with Will Rogers as a passenger, set out in a new plane to fly to Moscow over his old course, but in a leisurely manner. In taking off at a point 15 miles south of Point Barrow, the plane went out of control, crashed, and both men were killed.

REED, STANLEY F. (1884–). Appointed an associate justice of the Federal Supreme Court in 1938, succeeding Justice Sutherland. Reed was educated at Kentucky Wesleyan, Yale, and in law at Virginia, Columbia, and the Sorbonne in Paris. He entered public life as a member of the Kentucky Legislature (1912–16). Upon appointment of President Hoover, he was counsel for the Federal Farm Board (1929–32), and then of the Reconstruction Finance Corporation. As Solicitor General of the United States (1935–38), he argued successfully many important cases, such as the TVA litigation, second Gold Clause, and the Railway Labor Case. In the Schechter (NRA case) and the U. S. vs. Butler (AAA case) he lost important appeals. The Senate confirmed unanimously his nomination to the Supreme Court.

REEVE, ARTHUR B. (1880–1936). The creator of Craig Kennedy, Scientific Detective, was born in Patchogue, N. Y., and educated at Princeton. For three years (1903–06) he was assistant editor of *Public Opinion.* Four years later he published the first of his 3,000 stories of the solution of crime and of other mysteries, some of which attained an enormous vogue. Reeve also wrote many articles on a variety of subjects for magazines. His *Adventures of Craig Kennedy* ran in the *Cosmopolitan* Magazine from May 1910 to 1918. Of his many collected works, some of the best remembered are *The Silent Bullet* (1912), and *The Radio Detective* (1926). For the N. B. C. he wrote a series for the Radio Crime Prevention Program.

ROBINSON, JOSEPH T. (1872–1937). American politician, native of Arkansas. After graduating from the University of Arkansas and taking a law course at Virginia, Robinson was admitted to the bar of his native state. In 1894 he sat in the Arkansas Legislature. From 1903 to 1913 he served in the House at Washington, and resigned to take the governorship of Arkansas, to which he had been elected in November. Two weeks later the legislature chose him to fill an unexpired Senate term, and Robinson served in Washington for over 25 years. From 1923 until 1932 he was minority leader, and then served as majority leader for his party. In 1928 he was the running mate of Alfred E. Smith in the national campaign. Robinson was a fearless, energetic, and able leader, and one of the administration's most zealous aids after 1933.

ROCKNE, KNUTE K. (1888–1931). He was born in Norway, the son of a stationary engineer, who came to this country in 1893 to exhibit an invention at the Chicago Columbian Exposition. The family followed the father to America 18 months later. Rockne was dismissed from school for cutting classes. He worked four years in the Chicago Post Office as a dispatcher. With money he had saved, he completed a course in chemistry at Notre Dame in 1914. While captain of the football team in 1913, his men defeated the great West Point players, and took the world of sports by surprise. In 1918 he became head coach at Notre Dame. In his 13 years there, his teams won 105 games, lost 12, and tied five. In the 1929 Notre Dame-California game, over 110,000 spectators were in the stands. He developed some of the plays originated by others, such as the forward pass. Rockne also engaged in business, becoming sales manager of the Studebaker Corporation in 1928. In 1929 his health suffered from overwork, but later he recovered his full strength. Rockne was killed with several other prominent people in an airplane crash in eastern Kansas on March 31, 1931. He was survived by a wife and four children. In 1925 he became a Roman Catholic.

ROGERS, WILL (1879–1935). Undoubtedly in many respects the most famous entertainer of his age,—on the stage, screen, air, and in widely circulated news features. Rogers was born in the old Indian Territory, with some Cherokee blood in his veins. As he put it, "My people did not come over on the *Mayflower;* they met that boat as it came in." His people had some little property in land. After an elementary education in Missouri, he bought some land which he later sold for $7,000. With the proceeds he went on a tour taking him to the Argentine, then to South Africa, to Australia, and at last to Japan and China. Part of the time he acted as entertainer in various travelling troupes. For some time he merely showed his skill with the common cowboy's lasso. When he began to accompany this with some humorous patter, his fame grew by wild leaps. In 1914 he joined the Ziegfield Follies as an entertainer, and in 1919 he went first to Hollywood, but in 1922 was back with Ziegfield. His ventures on silent screens were only a moderate success, but in the talking pictures he gained immediate recognition. In the portrayal of quaint, humorous, countrymen, perhaps he had no equal since the late Denman Thompson. Some of his best pictures were *Doubting Thomas, County Chairman, Judge Priest, David Harum, Connecticut Yankee.* His last film was *In Old Kentucky,* and this, with *Steamboat 'round the Bend,* was produced after his death. Rogers was known for his generosity and public spirit. Irving Cobb once remarked that "Rogers was the only man I ever knew who rose to the heights of fame without climbing on the shoulders of other men." After the great floods of 1931, Rogers and Frank Hawks, the aviator, toured the country together giving performances to raise funds for the victims, securing $225,000 in all. Both these men suffered death in later airplane accidents. Rogers and Wiley Post were killed while taking off from a lake 15 miles south of Point Barrow, Alaska.

ROTHAFEL, SAMUEL L. (1882–1936). He will long be remembered as Roxy, prince of entertainers. At 12 he came to New York from Minnesota, and while still in his teens wandered through many lands and many jobs. He was with the United States Marines in Santo Domingo and China. After other attempts to settle down, he became a bartender in Forest City, Pa., married the daughter of his boss, and persuaded his new father-in-law to allow him to try setting up a motion picture house in the rear of the building. It prospered from the start. Roxy was born to entertain people.

He had a great flare for the varied, picturesque, and the decorative. B. F. Keith engaged him to assist in popularizing his chain of theatres. He revived interest in the Regent Theatre in New York City, established the Capital, and later built Roxy's, known for its size and magnificence. There "Roxy and his Gang" established his popularity on even a firmer basis. In 1934 he transferred to the new house in Rockefeller Center and again put on his Gang. After leaving there, he tried to interest British capital in a similar enterprize in London. His last venture in Philadelphia was not a success, and he died a comparatively poor man.

SELFRIDGE, H. GORDON (1864–). Founder and executive of the great mercantile house of Selfridge and Company in London and other cities of England. His life reads like an Arabian Nights tale of American business success; for he was born and trained in the United States, where he accumulated a substantial fortune and decided to retire at the age of 39. In 1939 he again gave up the duties of active business to complete his researches into the life of the Florentine noble and ruler, Cosimo de Medici. Selfridge was born in Ripon, Wisconsin, of New England ancestry. His father died before he was a year old, and his mother made their living by teaching school at Jackson, Michigan. He entered employment in a bank when he was 14, and in 1880 attached himself to the firm now known as Marshall Field and Company of Chicago at $10 a week. Before he was 30, that same house was paying him $20,000 a year, and in 1892 made him a junior partner. He retired first in 1903, but he found club and inactive life too tame for him. Then he bought another company in Chicago, but sold this before long at a profit of $250,000. In 1906 he went to London, and three years later completed an immense store, which was advertised to have 130 departments. One of them was a complete information service that would obtain for inquirers quickly the data on anything from the winners of the national derby in 1906 to the price of cheese in Wisconsin. In 1937 he became a British subject. The store in London is now managed by his only son. One of Selfridge's sayings is "If an employee does not earn advancement in three years, there is something the matter with him,—or with us." Another, "If you speak harshly to a worker in the morning, you will get little real hearty service from him that whole day."

SILLANPAA, FRANS E. (1888–). Finnish interpreter of the life of the common people and winner of the Nobel Prize for literature in 1939. The parents of this gifted man cleared a tract of forest in southwestern Finland, and their youngest child Frans (the only one of three to survive) worked his way through the University of Helsinki. He turned from studying science to writing, with a series of short narratives as his first publications about 1913. After two years of hesitation and writing under forced draft, he completed a novel in 1916, called *Life and the Sun*. For years now his reputation has grown throughout Europe, while his output increased to nine volumes of stories and at least six novels. His *Meek Heritage* in 1919 won him a national pension so that he could devote all his time to writing. This work had a profound influence in shaping the impressions and thoughts among the peasants of Finland after the World War.

SPENGLER, OSWALD (1880–1936). German philosopher, born at Blankenburg, Germany. After finishing his course and graduate work in the universities at Halle, Munich, and Berlin, he taught school. During the World War and after, his chief doctrine was that nations of Europe, and at last those of the New World, were doomed to decline and fall. Some of the chief contributions to this declining civilization are intellectual pride, greed of men, technical and unreasoned efficiency, and present forms of government, all leading swiftly, said Spengler, to our doom. *Decline of the West* by this German author sums up the current pessimistic view of history. "Western Europe has passed its zenith," is his summary of his thesis, "and it must now look forward to a rapid decline, and its civilization must soon range itself with the extinct civilizations of Greece, Egypt, and India. Our over presumptuous pride of intellect is the pride that comes before a fall." Though this man represents what might be called a minority view among historians, his works aroused endless debate and consideration.

STEINBECK, JOHN E. (1902–). Steinbeck's novel, *The Grapes of Wrath*, was awarded the Pulitzer Prize in May, 1940, for the best fiction of the year, after over 450,000 copies had been sold. The author wrote four novels before he won any particular attention. These began with *Cup of Gold* and the others were *Pastures of Heaven*, *To God the Unknown*, and *Tortilla Flat*, with eight editions and the sale of motion picture rights in 1935. Then followed his *In Dubious Battle* and *Mice and Men*, the latter a 1937 best seller. Steinbeck knew the central California region well. Here his father was a county treasurer for many years, and his mother once a country school teacher. The author and his wife lived for a time at Monterey, the scene of *Tortilla Flat*, and they have always preferred simple scenes away from bustle and crowds of people. From *The Grapes of Wrath*, the word Okies (sai to be made up from the words Oklahoma and Kansas) ha come into the American vocabulary. The sad story migrants, with their human emotions, tragedies, and lack success, led to much difference of opinion as to the soci background of the novel itself. Steinbeck illustrates, perhap what Ma Joad, the tough-fibered and tough-witted woman the book, remarked: "We ain't goin' to die out. People goin' on—changin' a little maybe, but goin' right on." Wit some of the latter parts omitted, the story proved the motio picture success of such efforts in recent years.

SWING, RAYMOND G. (1887–). This authorit on European affairs and celebrated news commentator wa born in Cortland, New York, educated in both arts and musi at Oberlin College, and served as apprentice in news writin on several Ohio papers. His introduction to European center came as correspondent for the Chicago *Daily News*. Tw vivid stories from him were the description of the Big Berth gun that shelled Liege during the World War and the sinkin of a Turkish transport on which he was a passenger. Whe the second World War broke out, he was on vacation abroad and later in America he won the medal of the Nationa Educational Conference on Radio for his description o events in Prague when the Germans took possession there He was an examiner for the War Labor Board (1918), corre spondent in Berlin for the New York *Herald* (1919–1922) and later was engaged for about ten years by the *Wall Stree Journal*, the Philadelphia *Public Ledger*, and the New Yor *Evening Post*. In 1935 he began commenting for the Britis Broadcasting Corporation and later for the Mutual Network His long familiarity with affairs abroad, and his peculia discrimination, doubtless made him one of the ablest an most reliable of news commentators. He never appeared fo a fifteen-minute broadcast without long and arduous prepara tion, which sometimes required reading eight or ten paper and ten or more hours of solid work.

THOMAS, JOHN CHARLES ( ). America baritone, favorite in operatic, radio, and motion picture rôle who was born in Pennsylvania and educated there and i Baltimore. He appeared first as a singer in London, Ontario in the Savage Company production of *Everywoman* in 1912 Some of his most familiar parts were in *The Peasant Girl Apple Blossoms*, *Maytime*, *Alone at Last*, and in *Aida* He sang with opera companies in Brussels, Philadelphia San Francisco, Los Angeles, Chicago and the Metropolita of New York. One of the most popular singers on radi programs, with a clear, firm and imaginative expression.

THOMAS, LOWELL (1892–). Known for hi versatility as teacher, historian, war correspondent, lecturer and radio commentator, Lowell Thomas began his busy life on a newspaper at Cripple Creek, Colo., and then i Chicago on the *Journal*. He also acted as professor at Ken College of Law, and instructor in English at Princeton During World War I, he served as observer and reporte with various armies. In 1919 he began to lecture in New York on the Arabian and Palestine campaigns. He wa editor of *Asia Magazine*, 1919–23. Author of many books o travel, recent history, and adventure, such as *With Lawrenc in Arabia* (1924), *Raiders of the Deep* (1928), *Kabluk th Eskimo* (1932), *Spain, the American Traveler's Handboo* (1932), and books on travel in Japan, Mexico, Canada, an India. In 1926–27 Thomas made an airplane flight, th longest journey by a passenger up to that time, coverin much of Europe, Asia, and North Africa to study aviatio developments and possibilities. In 1930 he became a radi news commentator.

TOGO, HEIHACHIRO (1847–1934). Japanese admiral born at Kagoshima. He was largely responsible for th modern Japanese navy; a man who rose gradually fro humble birth and the lowest ranks. He first saw servic in 1863; then from 1871–79 was in England for extensiv study, including a tour around the world with the Britis ships. As commander of the Naniva, in 1894 he ordered th shot fired which started the war with China, when a troo ship was sunk on its way to Korea. He engaged in othe battles, and after the war was made a rear admiral. In 190 he commanded the Japanese squadron that was part of th international force against the Chinese Boxers; in 1904 h was given charge of all sea forces of Japan. In the war wit Russia, he destroyed the Russian Eastern fleet by blockin them in a harbor and firing on them from land batteries On May 27, 1905 he engaged the enemy under Rojestvensk by blockading their path. For these feats he was called th Nelson of Japan and made an Admiral. On his deathbe he was created a marquis. No man, save the emperor, wa more revered in Japan.

TOSCANINI, ARTURO (1867–). Musical conductor born at Parma, Italy; the organizer and leader of the Nationa Broadcasting Company's Symphony Orchestra, 1937. Afte graduating from the Conservatory at Parma, he played th

cello, and at 19 first conducted in Rio de Janeiro. Some of his other engagements were at the Scala in Milan, the Metropolitan in New York (1908–14); New York Philharmonic Orchestra as guest and regular conductor (1926–28; 1928–33), and as general musical director for three years more. He was guest conductor in Philadelphia (1930–31) and at Beyruth and Salzburg in the festivals there. Throughout his long life he has been known for his skill and sympathy as conductor for young artists.

UREY, HAROLD C. (1893–). Discoverer of the heavy atoms of various chemical elements that may lead to important revelations in natural substances. He was born in Indiana, and was educated through the efforts of his mother, after his father died when Urey was only four. From 1911 to 1914 he taught school in Montana where the family home then was located, and in 1917 received his B. S. degree from the state university. During the war he engaged in commercial research in chemistry. In 1923 he took his Ph. D. degree at the University of California, and then adopted teaching as his life work. He went to Columbia University in New York in 1929. In 1931 he announced his success in isolating one "heavy" atom of hydrogen out of a total of 5,000 atoms. In 1934, Dr. Urey won the Willard Gibbs Medal, one of the highest awards for chemical research, and also the Nobel Prize in science for that year. He was then 41, the youngest man to receive the Gibbs award. By 1938 he had also found heavy isotopes of oxygen, nitrogen, and carbon, which three, with hydrogen, make up 75% of the material of the world. In 1940 Urey added sulphur to the list, a discovery which foreshadows important results in biology and medicine.

WALLACE, HENRY AGARD (1888–). Vice-president in the third term of Franklin D. Roosevelt, born in Adair County, Iowa. Wallace came of farming stock of Irish descent. He was the third generation in the family to edit a farm paper, and the second to be Secretary of Agriculture (1933–1940), his father, Henry C. Wallace having held the same post in the administrations of Harding and Coolidge. After his graduation from Iowa State College in 1910, he engaged in experimental farming, and until 1924 assisted his father with *Wallace's Farmer*. From 1924 to 1929 he was main editor, and then editor of the *Iowa Homestead* and *Wallace's Farmer* combined. He sponsored several ideas to help farmers, but is said not to have favored the compulsory feature of the crop control program. Some of his published works are *Corn and Corn Growing*, *America Must Choose*, *New Frontiers*, and *Technology, Corporations, and the General Welfare*.

WAVELL, ARCHIBALD (1883–). Leader of the British forces in the Middle East which crushed the armies of Italy in 1940 and early 1941. He was the son of major general A. S. Wavell and was trained at Winchester College and the Staff College. He served in the Black Watch in 1901, in South Africa, on the Indian frontier, 1908, and in the World War, 1914–18. Seriously wounded in France. Later (1916–17) he served as military observer with the Russian army in the Caucases, and then in Egypt, 1917–20. In 1921 he became a colonel; in 1933 a major general; in 1938, a lieutenant general; and in 1940, a general. During the disturbances between the Arabs and Jews in Palestine, Wavell restored order, but was said to have applied rather stern measures. In 1939 he was put in charge of the British armies in the Middle East, with headquarters at Cairo. Wavell allowed the Italians to advance into Egypt, while he was preparing to strike an effective blow, which at last fell with terrific force on Dec. 8, 1940. All the British forces were engaged in the lightning campaign which followed, sweeping the Italians from place to place, and cutting off, capturing or killing many thousands of picked troops. In this campaign, for the first time in history, land, sea, and air forces combined to strike at the same time along the Libyan coast. Italian strongholds including Sidi Barrani, Bardia, Tobruk, Bengazi were captured, completely destroying Italian power on the Mediterranean. In East Africa, Italian Somaliland and Eritrea were captured, British Somaliland retaken, and Ethiopia overrun. Early 1941 saw Wavell placing large forces in Greece, preparing for the Balkan battles.

WEYGAND, MAXIME (1867–). General Weygand again came into the American newspapers with the beginning of the second World War. When the Germans were overrunning eastern France, he replaced Gamelin as commander of the Allied Armies on May 19, 1940. Born in Belgium of uncertain parentage, Weygand had been a hard-working, close-mouthed, iron-willed man. Leopold of Belgium sent him to St. Cyr, where French officers are trained. Soon he became a remarkable mathematician and seemed destined to excel in tactics. He chose the active life of the cavalry, became a French citizen, and by the beginning of the conflict in 1914 had advanced so far that he became chief-of-staff to Marshal Foch. The two men worked in harmony seldom excelled, and Foch said, "Weygand, il est moi," equivalent in English to "Weygand, he and I are one." So they continued until 1923. When Pilsudski asked for Foch to come and help save Poland against the Bolsheviki in 1920, Weygand was sent instead, and did the task quickly and well. He was regarded by the Germans as representing the obnoxious clauses of the Versailles Treaty. Foch in 1929, before he died, advised France to call on Weygand in time of stress. Being officially retired at 68, he remained adviser and author of books to rouse his countrymen. In 1939, at the age of 72, he was sent to take charge in Syria, returned to France later, and then, after its collapse, went back to save what was left in the French protectorates outside Europe. He took the chair of Joffe in the French Academy in 1931. Weygand is the author of many books, including a *History of the French Army* (1938).

WILLKIE, WENDELL L. (1892–). His father was a successful lawyer at Elwood, Indiana, where both he and his son chose to champion the cause of poor and friendless people. At the University of Indiana, Willkie was a debater of some reputation, and his sister one of the leaders in forming student opinion. Indeed, the whole Willkie family has been noted for independence of thinking and acting. His mother was the first woman to be admitted to the courts of Indiana to practice law. Willkie helped himself in college and later by doing various odd jobs, his travels taking him into several mid-west states. In 1916 he obtained his law degree at Indiana. From the start he placed service above position or salary; when he retired from the presidency of a billion-dollar corporation in 1940, he was receiving $75,000, one of the modest figures for such a position. His law practice with the Firestone Company, and later as chief counsel of the Commonwealth and Southern, gave him a reputation as a close, faithful, and resourceful executive. In 1933, after four years with the corporation, he was chosen to take the place of the retiring head of the Commonwealth and Southern. When he was mentioned as a possibility on the Republican ticket, he insisted that he would not be "dropped into a mold." Nothing illustrates more aptly the nature of democracy in America than the nomination in 1940 of Wendell L. Willkie for the presidency. Prior to 1936 he had been a Democrat, in 1932 and later had fought for some of F. D. Roosevelt's favorite ideas, and as late as the 1938–39 issue of *Who's Who in America* was still listed as a Democrat. During his campaign for the presidency, Willkie travelled more miles and made more talks, it is said, than any man before him in a similar position.

WINANT, JOHN G. (1889–). Statesman and social reformer, born in New York City, educated at St. Paul's School at Concord, N. H., and awarded honorary degrees by Princeton, Dartmouth and New Hampshire Universities. In 1912 he became instructor in English and assistant rector of St. Paul's School; in the World War, rose to the rank of captain in aviation; in 1917–21 sat in the House of New Hampshire, then in the Senate for two years, and back in the House until elected governor in 1925, at the age of 36, the youngest governor then in the United States. He was defeated for governor in 1926, but was again elected in 1931 and continued in that position until 1934. He did much to reorganize the administration and industrial life of the state. President Roosevelt made him chairman of the Social Security Board in 1935, but two years later he again took the post he held in 1935 as assistant director of the international labor office at Geneva. In 1941, President Roosevelt appointed him ambassador to Great Britain. Before his appointment to the Court of St. James, Winant also was vice-president of the National Recreation Association and of the American Labor Association, and president of the National Consumers League.

WRIGHT, FRANK L. (1869–). Architect, born at Richland Center, Wis. Wright's background is that of a large family of farmers, teachers and preachers; his permanent home has been in Wisconsin, though he maintained offices in Chicago, Los Angeles and Tokio. From 1884 to 1887 he studied engineering in the University of Wisconsin, then became a draftsman in Chicago at $8.00 a week. Within one year he was with the largest firm in the city, but designing only small houses, while others planned the skyscrapers. In 1894 he opened his own office. He began to specialize in a new type of house construction, 100 of which appeared in time all over the middle west. In 1905 he first used plate-glass doors and windows for an office building in Buffalo, New York, which was also air conditioned and provided with metal furniture. Next he went to Japan, then to Tuscany, and in 1911 back to the United States, where he built his first model farm home in Wisconsin. He supervised the construction of the Imperial Hotel in Japan which in 1923 proved the first structure of its kind to resist the force of earthquakes. With the publication of his *Modern Architecture* (1931), a series of lectures delivered at Princeton University, his fame began to spread. In 1938 the *Architectural Forum* devoted a whole issue to his work. He was then training some 50 young

students on his Wisconsin estate. At 70, Wright was still producing new and distinctive designs for all sorts of small and large structures. The Museum of Modern Art, New York, concluded on Jan. 5, 1941, the first exhibition in America designed to trace the growth of the art of a single person from year to year. *Time* spoke enthusiastically and called this "as exciting a body of architectural thinking as has come from the brain of anyone since Michelangelo."

ZAHAROFF, BASIL (1849–). Known for years as the mystery man number one of the munitions industry; said to have been born in Turkey or Greece, of Greek or partly Greek parentage. He claimed citizenship in England, France, Greece, and Russia. Stephen Skuludis, the wealthy Greek business man, secured for him a connection with th Nordenfeldt munitions company, and later he became director in Vickers, and head of the Vickers-Maxim industr Sir Basil also had several other business connections in oi mines, and transportation. During the first World Wa the Allies found in him a trusted aid and zealous promote In 1918 he was awarded the Grand Cross of the British Em pire, which was only one of the many decorations fro governments. Zaharoff endowed a chair in French at Oxfor and a chair in English at the University of Paris. Chai of aviation at Paris, Leningrad, and London were als endowed by him. In 1924 he married the Duchess of Villa france de los Caballeros, who died two years later.

BABYLONIAN ART

The credit for the earliest important development of art, though formerly supposed to be Egyptian, is now believed to belong rather to the valley of the Tigris-Euphrates, commonly called Babylonia. In this land, we may see three distinct historical periods. In the first (c. 3000–1275 B. C.) an infinite number of petty wars between the Semitic and non-Semitic tribes are attested by thousands of clay tablets bearing cuneiform inscriptions which have been discovered. Toward the middle of this period, Hammurabi succeeded in welding a mighty empire, which after various vicissitudes was finally overthrown by the Assyrians whose dominance lasted six centuries. From 1275 to 626 B. C. Ashur-Nazir-Pal, Sargon, Sennacherib, and Ashur-Bani-Pal were the greatest of the Assyrian rulers. Finally the Babylonians regained a brief supremacy under Nebuchadnezzar whose brilliant reign lasted from 604 to 561 B.C.

This land lacks the more durable building materials such as stone, but has an abundance of good clay. Hence their structures were built largely of brick, either sun-dried, a perishable form, or the more lasting kiln-baked type. As a result of the materials, Babylonian works are massive in appearance with narrow, oblong rooms, thick walls, few windows. Isolated forms of support like columns are almost unknown for the same reason. In all probability, these rooms were covered by vaults.

One of the earliest palaces yet discovered is that at Tello, but the Palace of Sargon is better for study in that its parts are more completely preserved. This huge structure was set on the city wall some 60 feet above the surrounding plain, and so became part of the defense system. The building is arranged around a series of open courts; one for the king and his men called the seraglio, the harem or women's quarters, and the khan, which was the servants' place. In the platform on which the palace rests, an extensive drainage system employing the vault has been discovered. The decoration of this palace consisted largely of glazed colored bricks (faïence), probably of rugs and tapestries, and finally of friezes of low-relief sculpture. The best of these, coming from such Assyrian palaces as those of Ashur-Naizir-Pal, Sennacherib, and Ashur-Bani-Pal, show scenes of military enterprises or the hunt. The former seem to testify to the ferocity and cruelty of the Assyrians which are so frequently mentioned in the Bible. The work pays great attention to details of the heavy dress which swathes the bodies. Little interest is taken in anatomy, though the Semitic racial features are clearly indicated. Female figures are practically unknown. The portrayal of animals far surpasses that of human beings in vitality, spirit, and observation. The best examples occur in the Palace of Ashur-Bani-Pal.

Tower of Babel.—In the field of religious architecture, these people employed a pyramidal form composed of square masses, generally seven, of diminishing size set on top of each other. Each section was colored, a common system for the upper stages being black, red, blue, orange, silver, and gold, from bottom to top. An early example of the ziggurat was the Tower of Babel which is inseparably connected with Babylonian architecture. According to the account in *Genesis XI*, it was the result of the knowledge that

the people gained who went down into the valley of Shinar, and there learned the art of making buildings of clay bricks cemented with bitumen. Much surmise is indulged in as to its exact location. Among the buildings which seem to have the greatest claim to this distinction is the great temple to Marduk in the city of Babylon, which was seven stages high, and was known to the people as the house of the foundation-stone of heaven and earth. This was the building which Nebuchadnezzar restored. Another seven stage tower opposite Babylon in Borsippa, sacred to Nebo, has claims to this distinction. Many believe that the ziggurat in the city of Babylon may have been the building the writers had in mind.

RECENT EXCAVATIONS IN MESOPOTAMIA

The city of Ur no doubt was founded by the Sumerians more than 6500 years ago, and was raised on the usual mud terrace, partly to guard against rain and periodical floods, and partly for defense purposes. Its most important building was the Ziggurat. This great structure was really a stepped artificial hill on the top of which was built the "Shrine of the Moon God," the deity of the city. This site consisted of two separate and complete units; the sacred and town quarters, the former occupying a quadrangular area in the center, with angles toward the cardinal points; the town, lying outside this, was surrounded by its superincumbent city walls. The enclosure is roughly rectangular and measures 435 yards by 260 yards, and is entered by six gateways.

About 2300 B. C., Ur Nammu and afterwards his son, Dungi, brought the city to the height of her glory with their wonderful architectural work. After this period, the city rose and fell, was sacked and restored, and was forgotten after being conquered by the Persians about 400 B. C.

In excavating, the Third Dynasty level, 2300 B. C., was reached ten feet below the surface, and at thirty feet, bronze objects were found. The tombs are so rich in gold that they recall to mind the treasures of Agamemnon at Mycenae. One royal person was accompanied in death by his retainers, six bearers of the golden lances, his chariot with two asses, three grooms, his women singers and harp players, his gaming board, his wardrobe, and a rich treasury of gold, silver, copper, stone, vessels, weapons and ornaments. Two of the most important tombs discovered are those of King Mes-kalam-dug and Queen Shub-ad. Mes-kalam-dug belongs to a period centuries prior to that of Sargon of the First Dynasty of Ur. This early period about 3500 B. C., before unknown to archaeology, is now illustrated by examples of art unrivaled by those of any later time in Mesopotamia.

Arched roofs were still intact in some of the tombs, and from the excavations at Tello, Kish, and Tell-al-obud, it is now recognized that the column as an architectural form was known and used by the Sumerians. E-dub-lal-mah gives us the form of an arched opening in one of the side walls. The arch is a good example of properly constructed barrel vaulting. Corbel vaulted brick tombs had been found and also one type of very primitive system of barrel vaulting.

The Sumerians were great builders and constructed extensive drainage systems.

For the first time in Babylonian excavation we are able to obtain an idea of the upper par and roof of a temple, and to get complete mate rial for reconstructing its appearance. Thi temple stands upon the ruins of the oldes Sumerian kingdom which antedates 3500 B. C

One of the most important objects discovere in Mesopotamia is the lapis and shell inlai "standard" with its scenes of the court of th king or chief with retainers, in peace and war the "Bayeux Tapestry" of Sumer, as it ha been called. At Kish a sculptured and painte portrait head has just been unearthed; it is a example of a lost art in Mesopotamia from day before the flood. This is a Sumerian hea molded true to life without any trace of Mongolian type. This head presents the prob lem of the origin of civilization.

EGYPTIAN ART AND ARCHITECTURE

The Ancient or Pagan Period extends from the First Dynasty (about 3400 B. C.) to the time of the Roman Empire. The monuments of the first six dynasties were marvelous feats of engineering, but with a simplicity and grandeur of their own. This was an era of gigantic pyramids and mastabas. Over 100 of these ponderous tombs were erected thirty-four centuries before Christ, establishing the existence of the use of metals and a knowledge of mathematics and mechanics of no mean order. The pyramids were the royal tombs of the earlier dynasties; the mastabas, built in rectangular form, were designed for persons not of royal birth. The chapels in the mastabas were richly decorated in low relief sculpture and painted with scenes taken from daily life. During the Middle Empire (c. 2160–1788 B. C.) a great change spread over Egyptian Architecture; non-sepulchral temples of a grand and imposing type first appear, and the mastabas give place to rock-cut tombs rich in design and ornamentation. Of these rock-cut sepulchers, the most celebrated group is at Beni-Hassan on the Nile. The creation of a distinct order of temple architecture is most noteworthy, as not only was a model set for succeeding generations in Egypt, but likewise for the Greeks. The lintel, and not the vault, became the basis of design; quarried blocks were carefully dressed and laid; columns supporting architraves were lavishly used; while color and relief sculpture embellished the whole. The period that followed, known as the New Empire (c. 1580–1080 B. C.), was the golden age of Egyptian art and architecture. The land was covered with temples and palaces of a size and grandeur never before attempted.

Four essential elements appear in the standard temples. The entrance was between two masses of masonry with slightly sloping sides linked together by a lower element, the whole being called a "pylon." This gateway gave access to an open court, the peristyle, whose walls were bordered with a colonnade. The third element was the hypostyle hall, whose roof was supported by colossal columns. Finally the sanctuary at the rear on the long axis of the building was surrounded by a number of small chambers whose use has not yet been surely determined.

Some of the most impressive monuments of

the new Empire were the Amenopheum; the temple of Rameses III., at Medinet Abu; the mausoleum of Queen Hatshepsut at Deir-el-Bahari and the Ramesseum close by; the temples of Abydos, Medinet Abu, and Gurneh; a little temple of Khons at Karnak; and the gigantic temples of Karnak and Luxor. The colossal temple of Karnak was begun during the Middle Empire, succeeding dynasties carrying on the work till its completion in the time of Euergetes, the third of the Ptolemies. Except in matters of scale and ornament, all these monuments conformed to the same general type. The splendid achievements of the reigns of Thothmes I. and III., Amenophis III. and IV., Seti I., and Rameses II., were followed by an era of decline; and not till the time of the Macedonian conquest did architecture revive. The temples of the Ptolemaic and Roman period maintained the best traditions of Egyptian art. The majestic group of temples on the island of Philae near the second cataract rival the splendor of the new Empire. The temples of Denderah and Edfu are still well preserved, while others of less importance may be seen at Esneh, Dakkeh, Kalabshé, and Kardassy. Of secular and military architecture there are few remains of importance. The fortresses of Thebes and Memphis, and the recent investigations at Semna Uronarti; the fortified walls of San, Saïs, and Thebes, besides scattered remains of forts, granaries, and domestic buildings, bear witness to the activity of this period.

The Coptic Period.—From the third to the seventh century Egyptian art fell into decay, and did not revive till the Moslem conquest in 638. The Coptic Christians covered the land with their churches and monasteries, built in a cosmopolitan style which ignored both Egyptian tradition and Byzantine practice. Few traces of Coptic architecture remain, having been swept away by the Arab invaders.

The Copts were the first to introduce into architecture the systematic employment of the pointed arch. The later Coptic churches were basilican in design.

Sculpture.—Unlike architecture, large sculptural works were produced in Egypt at an earlier date than in Babylonia. The aim of the early sculptor was to make a figure as life-like as possible, so that its *ba* (spirit) and *ka* (soul) might easily recognize it after death. The works of the old kingdom are very realistic showing some interest in anatomy. These characteristics are especially prominent in representations of the lower classes. Good examples are the *Seated Scribe* (Louvre) and the *Dwarf Nemhotep*. These sculptures were mostly deposited in tombs, and in the inner chamber of each tomb were placed several statues illustrating different periods of the individual's life, as well as several scenes in low relief, vividly colored. In the middle kingdom, the sculptors, possibly owing to religious control had less freedom than their ancestors of the Fourth and Fifth Dynasties, and as a result, the typical works show marked conventionalizations. Under the New Empire, sculpture became freer and more elegant; two new forms came into use—the sunken outline relievo (*schiacciato*) and the sunken relief (*cavo-relievo*). At this time, sculpture inclined to be either colossal in size or highly decorative in treatment. The beauty of drawing and purity of line in such examples as *Rameses II.* (Turin Museum), *Queen Ti, Queen Nofretete,* and such reliefs as those from the rock cut tomb of Seti at Abydos or the Princess Bintanat are remarkably fine and should be rated with the artistic masterpieces of all time. Finally in the Saite period (Twenty-sixth Dynasty) which is known as the Egyptian Renaissance, a noteworthy return to the realistic aims of the Old Kingdom took place in spite of the very hard materials which were employed. Wooden statues, usually of acacia and sycamore, were very popular during the earlier dynasties.

Color was an essential feature of Egyptian sculpture. Colored stones, such as basalt, red granite, and diorite, were frequently used, or, when softer stones were employed, the colored effect was procured by stucco and paint. In general, sculpture conformed to a rigid conventionality without regard to perspective or realism. In reliefs, the head was in profile and the eye in front view; the shoulders full front; the trunk three quarters; the arms and hands, also the legs and feet in profile. It seems to have been the idea of the artist to present as much as possible to the view; hence these flattened-out representations. The Egyptians placed one row of figures above another to represent different planes. They did not use perspective, but they were lavish in details and decoration. Conventional Egyptian ornament was mainly based on flower-forms such as the lotus and the papyrus.

Side by side with the traditional sculpture peculiar to tombs and temples, there grew up a secular kind, freer and bolder in design and of more varied types. Such is the famous statue of King Khafra, sitting in the conventional attitude with hands on the knees. A familiar type is the seated figures of husband and wife. The celebrated *Sphinx* of Gizeh stands apart from any class. The Egyptian deities were usually represented in a composite form, it being customary to set an animal's head on a human body, or else the god in human form was accompanied by his particular emblem, such for instance as a cat, jackal, ibis, ram, hawk, lion, or crocodile. In its political representation Egyptian art is still more interesting. One of the commonest scenes is that of a gigantic king with captives cowering at his feet; another is that of a triumphant monarch in his chariot overwhelming his foes. These scenes throw great light on the customs and industrial arts of those early periods. Under Ptolemies, sculpture came under the influence of Greek art.

The minor arts developed very early. It is in this field that the greatest contributions have been made by recent archaeological discoveries such as the Tomb of Tutankhamen (Eighteenth Dynasty), and the investigations of Dr. Reisner in the old kingdom. Gold enamel jewelry of delicate workmanship can be traced back even to the Ancient Empire. The traditional designs were applied also to furniture, ornaments, and utensils—wood, ivory, and metals being fashioned with equal skill. The distribution of these articles by Phoenician and Greek traders considerably affected the growth of European design.

Gizeh, Pyramids.—Colossal pyramidal tombs or cairns are a striking feature of Egyptian architecture. They are built of solid masses of stone or of brick; and each pyramid has one or more chambers with concealed passages leading to them, while in the larger pyramids false passages were made to render desecration difficult. The sarcophagus, or mummy case, was placed in the chamber before the superstructure was erected. The pyramids of Gizeh are nine in number, but the six small ones sink into insignificance by the side of the three great pyramids of Khufu (or Cheops), Khafra (or Chefren), and Menkaura (or Mycerinus), which were constructed about 2900 B. C. They are accurately oriented, and that of Khufu and of Khafra are "so proportioned that the perimeter of the base closely approximates the circumference of a circle having the altitude of the pyramid for its radius." The Great Pyramid had a base of 764 feet and was 482 feet high (it is now 450 feet). It has an unfinished subterranean passage from which an upward sloping passage leads to two other rooms, the larger one (the King's) being ventilated by two air flues about nine inches square which lead off to the north and south sides of the pyramid. The King's Chamber is 19 feet 1 inch high, and 34 feet 3 inches, by 17 feet 1 inch in area; the Queen's Chamber is 20 feet 3 inches high, and its area is 17 feet by 18 feet 9 inches. The pyramid of Khafra was 454 feet high on a base of 717 feet; that of Menkaura is steeper, and was 213 feet in height and 253 feet square. Each of these pyramids was originally faced with polished granite. Pyramidal sepulchers are not confined to Egypt; the tomb of Caius Cestius in Rome is in this form.

Karnak and Luxor.—Of the group of temples at Karnak, near the site of ancient Thebes, the most important was the temple of Ammon founded during the Twelfth Dynasty. It stood in an inclosure about 1,500 feet square, and an avenue of ram-headed sphinxes led from the river to the main gateway—a colossal pylon, 370 feet in breadth by 142 feet in height. Within the great court and in a line with the gateway were twelve enormous columns, six on either side; six of these are well preserved. A second pylon gate leads into a magnificent hypostyle hall, 171 feet long by 338 feet broad, its roof supported by 134 columns in 16 rows. This hall is one of the finest works of Egyptian architecture. The columns of the central aisle of this hall are 69 feet high, some of the largest ever employed on the interior of a building. They enable light to be introduced by a clearstory, which projects above the roofs over the lower portions of the hall. At the upper end of the great hall is another pylon gate, now in ruins, leading to an open court, in the center of which is an obelisk 76 feet high. Beyond this again is another court in which stands the tallest obelisk in existence. There are a succession of smaller courts, corridors, pylon gates and halls. To the southwest of Karnak and on the site of Thebes stand Luxor and its famous ruins of palaces and of the temple dedicated to Ammon, Mut, and Khons, the Theban triad. Near the main gateway of the great temple stood two obelisks erected by Rameses II.; one is still there, and the other is now in the Place de la Concorde, Paris. In the great court stood six huge statues of Rameses II., three of which are still in position.

Obelisk (from the Greek ὀβελίσκος, diminutive of ὀβελός, a spit, pointed pillar).—An obelisk is a tall and tapering four-sided pillar terminating in a pyramid and is generally a monolith. The pyramid was invariably capped with metal, usually gilded bronze. These monuments originated in Egypt, and were placed at the entrance of the temples and palaces, both for decorative effect and the recording of royal deeds and victories. Their sides were generally covered with hieroglyphic inscriptions deeply cut into the granite. One of the tallest of obelisks is that of Queen Hatshepsut at Karnak, which rises to 97½ feet, its diameter at the base being 8½ feet; its mass is estimated at 4,873 cubic feet and its weight at 367 tons. An obelisk of red granite, 66 feet high, still stands on the Nile, the solitary monument of the fallen city of Heliopolis. This is the oldest obelisk existing, and is said to have been erected by Usertesen I., the second king of the Twelfth Dynasty. The famous "needles of Cleopatra" were erected originally at Heliopolis by Thothmes III. During the rule of the Ptolemies they were transferred to Alexandria. In 1879 one was taken to London and placed on the Thames embankment; the other was brought to New York, in 1880, at the expense of William H. Vanderbilt, and erected in Central Park, February 22, 1881.

GREEK ART AND ARCHITECTURE

The Greeks carried architectural art to a high degree of excellence. They made no use of the principles of the arch in their important buildings, but confined themselves to the columnar form; yet their architecture combined Egyptian grandeur with a chasteness and symmetry of design unrivaled by any other nation. As architecture is generally influenced by available building materials, Grecian temples were originally made of wood, which largely accounts for the variety of forms found in their more permanent architecture. Stone was gradually introduced, but the traditional forms remained; the architrave represented the girder resting on the columns, which supported the principal rafters; the triglyphs were the beam ends; the small circular ornaments in low relief, called guttae, were the nail heads; the metope slabs filled the former intervals between the beams; the pediments were occasioned by the gables formed by the sloping roofs.

The three distinct orders of architecture developed by the Greeks were the Doric, Ionic, and Corinthian. The distinctive character of the orders is chiefly shown in the column and the entablature. The Romans adopted the Grecian styles, modifying them and adding two others, viz., the Tuscan and the Composite.

The Doric Order.—This is the earliest of the Greek orders, and the one generally used in their temples. The Doric column tapered toward the top and had a strong entasis or curved profile. It had no base, but rested directly upon the stylobate or upper step of the foundation. It had generally twenty shallow flutings separated by a sharp ridge or arris, and in height ranged

from four to six times its lower diameter. The capital was plain, and consisted of (1) the annulated necking, (2) the echinus or ovolo, whose peculiar curve is supposed to have been taken from the sea egg, and (3) the abacus, which was a square flat stone without moldings of any kind. The entablature was divided into (1) the architrave, which was plain and was surrounded by a projecting flat molding, the taenia, below which under each triglyph was a bar (regula) with six guttae; (2) the frieze of triglyphs or blocks suggesting the ends of the beams of the ceiling and divided into three by two vertical cuts, and the metopes which might either be left plain or be adorned with sculpture or painting, and (3) the cornice, the projecting or crowning member of the temple. The cornice is composed of bed moldings, the projecting corona on the under side of which are mutules with guttae over each triglyph and each metope, and finally the cyma molding crowning the whole. The Doric style was used in the greater number of Greek temples known to us, of which the Parthenon at Athens is the finest example.

The Ionic Order.—The more graceful Ionic shaft tapered less, and was taller than the Doric, being from eight and a half to ten diameters in height. It had a slighter entasis, and was ornamented by twenty-four deep flutings separated by narrow fillets. The column had a base consisting of concave moldings (scotia) and convex moldings (torus) in various combinations. The larger moldings were separated by fillets. The so-called Attic base was composed of an upper and lower torus between which was a scotia and two narrow fillets, and was in height one third of the thickness of the column. The capital consisted of (*a*) an ornamented neck, (*b*) two parallel scrolls or volutes occupying opposite sides and supporting (*c*) an abacus. The volutes form the distinctive feature of the Ionic capital, and a side view gives the appearance of a scroll of parchment with the rolls hanging downward on each side. The Ionic entablature consisted of (*a*) an architrave, divided vertically into three parallel and horizontal bands; (*b*) a frieze, which was continuous or unbroken (having neither triglyphs nor metopes) and sometimes ornamented by a band of painted or relief ornament; and (*c*) a molded cornice. Unlike the Dorians, who preferred moldings of simple lines decorated with severe ornament, the Ionians introduced a more refined profile and more delicate decoration. The best examples of the Ionic style were the famous Erechtheum at Athens, and the temples of Ilissus and Minerva Polias, all three of which are in ruins.

The Corinthian Order.—This order was developed later, and there are only two famous remaining specimens in Greece dating from pre-Roman times, viz., the choragic monument of Lysicrates at Athens, and the Tholos, or circular building, at Epidaurus in the Morea. No traces of the order are to be found in the remains of Corinth. The Corinthian was the lightest and most ornamented of the Greek orders, its most important change from the Ionic being in the different capital. The base, an elaborated copy of the Ionic, was two-fifths the diameter of the column in height. The column was 10 diameters high, with flutings like the Ionic. The capital resembled an inverted bell with two rows of acanthus leaves clustered round it, above which were eight pairs of small volutes, surmounted by a molded abacus with concave sides. The entablature was more elaborate than the Ionic, the architrave being divided into three horizontal fillets separated by a narrow molding from the frieze, which latter was decorated with bas-reliefs; while the cornice was both richer and more varied, with the addition of volute-like mutules and modillions.

It is interesting to note that the Greeks usually blocked out their columns before erecting them, and only after the construction of the buildings were the channels, moldings, and the like cut. Until the adoption of marble in the fifth century, the surface of the column was thinly stuccoed.

Caryatids.—A caryatid was a sculptured female figure used as a support in place of a column or the like. Corresponding male figures were called atlantes or telamones. Instances of Caryatids in Greek architecture are rare, the most important remains being the portico called Pandrosium, forming part of the Erechtheum at Athens. In this example the figures take the place of columns, and support the entablature.

What we know of Greek architecture is derived from the remains of ancient temples. Unlike the Egyptians, the Greeks relied for beauty and stateliness on the columns surrounding their structures. Their temples were generally of moderate size consisting merely of an oblong cella surrounded on all four sides by a continuous free-standing colonnade, and being shrines to house the image of the deity rather than places of worship. The sunlight streaming through the main doorway was enough for the purpose of lighting the interior, and windows were unnecessary. Flat-roofed buildings, such as the Telesterion at Eleusis, may have been lighted from the roof, but the ordinary gable-roofed temple had no such device. The Greeks, after having fixed upon the types of their architecture, never departed from them but generation after generation went on refining and perfecting their lines; and no matter whether the temple was great or small, the change of scale did not affect the harmony or simplicity of composition. The life and requirements of the Greeks did not call for large buildings. Even in their largest temples, the chamber or cella barely exceeded 40 feet in width. Buildings for the shelter of the public were called stoas, long galleries of colonnades facing the street or public square, and in these also the column was the chief architectural feature. Color was extensively used to accentuate the architectural forms.

Sculpture.—As a concrete art, sculpture attained supreme perfection at the hands of the Greeks who developed it from the stylized archaism of the Egyptians to the fullest expression of human beauty. Greek art culminated during the Attic Period from about 480 B. C. to 323 B. C.

Up until about 480 B. C., Greek sculpture was in a formative period. The sculptors were learning their technique, improving their knowledge of the human figure and in general providing themselves with the facilities to express

their conceptions. It is therefore, on the whole, a period of experimentation, but a few great works are preserved; the decorative quality of the Hera of Samos, dedicated by Cheramyes, c. 550, and the freshness, vigor, and the naïvete of the pediments of the Temple of Aphaia at Aegina, c. 480, probably carved under the supervision of Onatas. The fine quality of the Parian and Pentelic marbles provided the artists with an ideal material. The influence of the palestra and the Olympic games were considerable. An appreciation of living beauty, combined with the ease of obtaining the finest models, gave an unbounded stimulus to sculpture. Added to this was a great demand for statues of the victorious athletes.

About 480, after the repulse of the Persians, the Greeks realized more and more fully their own possibilities and developed rapidly. The golden age of Pericles in politics, the wealth accruing to Athens as head of the Delian League, and the Periclean policy of rebuilding the city in a more perfect form provided the opportunities for artists to execute great projects. The intellectual activity of the period stimulated noble and ideal conceptions. It is the period in which the great deities of the Olympian Pantheon were put into visible forms. At the very beginning of this period, the figure of Myron, one of the six great Greek sculptors judged by either classic or modern knowledge, is seen. He attained complete freedom in the handling of the body, but attempted no marked expression in the face. His preference for a pose of momentary rest during violent action is illustrated in the *Discobolus* or the group of *Athena* and the satyr *Marsyas*. These works, like many of the Greek masterpieces, were designed to be executed in bronze. The marble copies we possess were generally carved by inferior Roman craftsmen, and can give but a faint reflection of the beauty of the original. The awkward tree trunks used as supports in many of these works are the result made necessary by changing the medium from bronze to marble. Calamis and Pythagoras of Rhegium were the most famous contemporaries of Myron.

Phidias perhaps touched the highest point in Greek sculpture in the chryselephantine statues of the *Athena Parthenos* in the Parthenon and the *Zeus* placed in the Temple of Zeus at Olympia. Although these have both disappeared, we may form some conception of his style from the sculptured decorations of the Parthenon at Athens which he supervised. There we find the most remarkable skill in composition in both pediments and frieze coupled with perfect technical ability. For greater monumentality and breadth of effect, he preferred to eliminate the smaller anatomical details. The figures are idealized to express superhuman natures. It has been truly said of them, "They look like human beings, but where is one to find such models." Other men of this time include Agoracritus of Paros; Alcamenes, the creator of the celebrated *Aphrodite of the Gardens;* Cresilas of Cydon; and Paeonios of Mende, the creator of the famous flying *Nike* (Victory) at Olympia. Toward the end of the fifth century, Polycletus formulated a theory of an ideal human figure expressed in the statue of the *Doryphoros* or Spearbearer.

Up to this time, the sculptors had not attempted to make the heads expressive of emotion, but this desire begins to be felt in the fourth century. At the same time, the idealization of the fifth century is replaced by the slowly growing tendency to realism. The change in the direction of individual patronage rather than the corporate employment of the preceding hundred years due largely to the impoverishment of the city states caused by the disastrous Peloponnesian war also suggested the slighter beauties such as grace and rhythm rather than nobility. Praxiteles illustrates those tendencies in the first half of the fourth century. In him, we find the body thrown into a delicate rhythmic S-curve. In the heads, a dreamy expression is attained by the far-away gaze of the eyes created by delicate transition of the shadow. He was very famous in antiquity for his unequaled beauty of surface finish and differentiation of texture which are well attested to by the *Hermes carrying the Infant Dionysus,* the one sure original fragment we have from the hand of any of the greatest Greek masters. He is commonly condemned of weakness, a charge which is supported by the Roman copies of his works, but not at all by this original. His other most famous works include the *Aphrodite of Cnidos,* the *Eros Centocelle,* the *Satyr* (Marble Faun of Hawthorne), and the *Apollo Sauroktonos.* Scopas tended to the darker sides of life as Praxiteles had to the sunnier. He attained an intensity of expression by wide-open eyes looking upward from under brows which were accented by a roll of flesh in the corners of the eyes, and by lips parted as though for heavy breathing. His best known works are the fragments of the Temple of Athena Alea at Tegea, and the *Meleager.* At the end of the century, Lysippus of Sicyon continued these fourth century characteristics in a somewhat dry fashion. He lightened and made taller the ideal human figure of Polycletus by making the head one-eighth rather than one-seventh the total height of the figure. An expression of slight weariness appears in the *Agias* and the *Apoxyomenos.* His portrait of *Alexander the Great* is known to have been that monarch's favorite. Other fourth century sculptors were Kephisodotus who may have been an older relative of Praxiteles, Timotheus, Bryaxis, and Leochares.

After the death of Alexander and the break up of his empire, Greek ideas became mingled with elements of Eastern sculpture. While there was no falling off in technical skill, taste and the conceptions in general were on a slightly lower plane than those of the great period. Then centers of artistic production moved from Greece to Pergamum, Rhodes, Alexandria, and elsewhere. In Pergamum, celebrating the victories of Attalus I. over the Gauls, a series of extremely realistic works were produced including the famous *Dying Gaul.* The differentiation of racial types is an instance of the realism of the period. The succeeding reign of Eumenes II. saw the great altar of Pergamum with its frieze representing the battle of the Gods and Giants. Although masterful in composition and execution, the excessive muscularity

FAMOUS TOMBS

1 Tomb of Haroun-El-Raschid, Chief of Bagdad, Bagdad. 2 Tomb of Rachel, wife of Jacob, near Jerusalem. 3 Tomb of Napoleon, Paris. 4 Tomb of Mumtez-i-Mahal, Wife of Shah Jehan, Agra, India. 5 Trench of Bayonets, Verdun, France.

of the figures, the almost pedantic treatment of the subject, and the general restless effect may weary a spectator after his first amazement has been subdued. Portraiture at this time became far more realistic. A similar feeling obtains in the pictorial treatment of reliefs which attempt to treat of landscape and matters which perhaps belong more properly to the art of painting.

Finally in what is known as the Graeco-Roman period, 146–27, we find the Greeks, as it were, training the Roman taste to appreciate Greek ideas. The exaggerated realism of the second Pergamene school and its technical skill are found again not only unabated but increased in the famous *Laocoon* group, which though greatly admired in antiquity and in the Renaissance is now considered as an inferior piece of sculpture. The Neo-Attic school and the school of Pasiteles, in addition to copying the famous Greek originals for the Roman market, attempted to revive the virtues of the great period of Greek sculpture, but without a great deal of success.

Athens, the Erechtheum.—This temple is laid out on an unusual plan in order to house several cults and sacred shrines. It takes its name from Erechtheus, a local divinity, but included the tomb of Cecrops, the rock showing the marks of Poseidon's trident, the salt spring which he created in his contest with Athena for the land of Attica, and Athena's sacred olive tree was just outside to the west. A porch to the east, one to the north, and a small porch on the south of the building were erected. It is possible that the usual symmetry which the Greeks loved was to be obtained by duplicating the building to the west on an axis running through the north and south porches. The north porch uses the richest of Greek Ionic columns with a band of honeysuckle carving around the neck of the capital, and the upper torus of the base decorated with a guilloche molding. The doorway of this porch is famed for the beauty of proportions. In the south porch, the usual columns have been replaced by sculptural maidens bearing on their heads the entablature of the porch; to prevent this member from seeming too heavy for them to carry, the frieze has been omitted. The figures stand upon a parapet; they have been made sturdy and well formed to do their work. All in all, they are probably the most successful caryatids ever executed. The frieze consisted of white figures against a background of black Eleusinian limestone, but it is so damaged that not even the subject can be identified. The work was begun in 435 B. C. and finished in 404 B. C. The building was converted into a church in the fifth century after Christ, and later, in the Turkish period, into a residence. One of the caryatids was removed to the British Museum by Lord Elgin. The building was repaired in 1902–8.

Athens, Parthenon.—The famous Doric temple of the goddess Athena Parthenos is on the Acropolis at Athens. Its architects were Ictinus and Callicrates, and the entire work was done under the supervision of the celebrated sculptor Phidias, during the reign of Pericles (465–439 B. C.). It is 227 feet in length, 101 in breadth, and 65 in height, and was built wholly of Pentelic marble except the roof, which was of Parian marble. In the eastern end of the temple stood the colossal ivory and gold statue of *Athena* by Phidias. It was 39 feet high, and the value of the gold alone is estimated at about $465,000. The edifice was surrounded by columns 34 feet 3 inches in height.

All 92 metopes were decorated with sculpture in relief, probably representing the four epic struggles of civilization against barbarism: The battle of the gods and giants on the east; of the Greeks and Amazons on the west; Centaurs and Lapiths to the south; and on the north perhaps scenes from the sack of Troy, though the work is too mutilated to be sure. Because of their position in the temple, it is likely that the metopes were put in place and finished before the rest of the sculpture. At least they fail to show the uniformity of style which characterizes the rest of the sculpture, especially the pediments, and some of the metopes are distinctly inferior in workmanship. The frieze represents the Pan-Athenaic procession held every four years in honor of the goddess Athena, the patron of Athens. This marvelous work, 3 feet 4 inches high, and 520 feet long shows all the classes of Athenians who took part in the celebration: Maidens, young men on horseback, magistrates, chariots, sacrificial animals, and so on. Marvelous variety of pose results in fine composition and movement. The height of the relief varies from 1¼ inches at the bottom to 2¼ inches at the top to compensate for the sharp angle from which it would normally be seen by a spectator on the ground. An impression of depth is attained by allowing one plane to overlap another. The sculpture on the eastern pediment represents the Birth of Athena, and the Contest of Athena and Poseidon for the land of Attica on the western pediment. Although much has been lost, enough remains to make it evident that these two scenes were unexcelled in skill of composition. The difficult triangular space was perfectly filled by well balanced and symmetrical groups of figures on either side of the pediment. Attention was focused by successively increasing waves of interest from the corners to the center. Any figure is superb in itself, but the group of the *Three Fates* from the East Pediment illustrates the fine qualities of sculpture. Much of the sculpture was removed by Lord Elgin in 1801, and is now in the British Museum.

The Parthenon was transformed into a Christian church about the beginning of the sixth century, and was dedicated first to St. Sophia and later to the Virgin. After the conquest by the Turks (1458) it became a mosque, and a minaret was constructed in the southwest corner. During the siege of Athens (1687) by the Venetians, it was used as a powder magazine, and on September 26, a shell crashed through the roof and destroyed the inner portion of the temple.

Halicarnassus Mausoleum.—This tomb—one of the seven wonders of the ancient world—was erected in 353 B. C. by Queen Artemisia in honor of her husband, Mausolus. It was the work of the sculptors Scopas, Bryaxis, Leochares, and Timotheus. It was built of white marble with Ionic columns. Its total height was 140 feet. The Knights of St. John pillaged it in 1622 to build the citadel of Budrum, and speci-

mens of these "Budrum Marbles" were sent to the British Museum by Sir Stratford Canning (1846) and by Newton (1857).

Olympia, the Heraeum.—This temple was thoroughly investigated by the German scholar Curtius from 1875–1881. Traditionally the temple was founded in 1096 B. C., but very few people accept that date to-day. It is, however, highly probable that the original building may have been erected in the eighth century B. C. This structure was of wood and sun-baked brick. Pausanias tells us that in his day one of the columns was of wood. The rest of the wooden supports seem to have been replaced by stone at varying times from the sixth century B. C. on, which indicates that the Doric order may have originated in wooden construction. Within the ruins of this temple was found the Statue by Praxiteles of *Hermes carrying the infant Dionysus.*

Olympia, Temple of Zeus.—Built by the architect Libon of Elis from 468–456 B. C. The temple is typical of the standard Greek form, now fully developed. It measured 210 feet by 90 feet along the stylobate. The pediments were filled with sculpture. On the east was represented the mythical chariot race of Pelops and Oenomaus, with a number of attendant figures. The subject was appropriate, as the supposed predecessor of the Olympic games. The western pediment, which is more skillful in composition, illustrates the struggle of the Lapiths and Centaurs at the wedding of Pirithous. Many details of the individual figures are eliminated due to the height above the ground from which the figures would be seen, which made detail unnecessary. The conception of the figure of Apollo as arbiter of the battle in the west pediment is one of the most majestic of all time; calm and undisturbed amid violent action, he embodies the Greek ideal of divinity. The twelve metopes placed over the pronaos and opisthodomus, within the encircling colonnade, tell of the labors of Heracles; the composition of many of them is remarkably fine. Within the temple was the great gold and ivory statue of Zeus by Phidias, one of the seven wonders of the ancient world.

ROMAN ART AND ARCHITECTURE

The practical and warlike Romans adopted the art of the vanquished Etruscans and afterwards that of the conquered Greeks. From the Etruscans they acquired the principles of the arch and the vault. At first the Romans preserved the inviolability of the classic orders, retaining the ancient form of the temple with its purity and simplicity of style. But with the growth of Roman power came the necessity for more varied monuments, and architectural traditions were no longer found adequate to growing secular needs. The temple, which in Greece had been the glory of a nation's art, sank into comparative insignificance, and gave place to civic buildings of national importance and splendor of design. At the beginning of the Christian era the introduction of circular-formed structures with majestic domes enabled the Romans to erect buildings of imposing grandeur throughout their vast empire. The arch, lending itself to any scale and supporting any burden, was made the constructive basis of civic architecture. Disdaining convention, the Romans combined the arch and the order, and subordinated chasteness of design to grandeur of conception and effect. They have been blamed for this innovation, as well as for not designing an architecture of their own to harmonize with the arch. But their genius lay in successfully combining these various styles, evolving harmony out of complexity, and giving a splendor to interiors such as had never been known before. The spaciousness of their edifices was made possible by the use of concrete, which became general in the time of Augustus. The Tabularium on the Capitoline is one of the earliest examples of this combination; the Colosseum, the Basilicas and the theater of Marcellus are on a similar principle, and in all of these the Greek orders serve as an addition to the Roman arch and vault. This ornamental use of the orders is illustrated by the employment of superposed orders of engaged columns and by the adaptation of engaged columns and the entablature to enframe an arch. The Romans also employed the segments of circles in place of the freehand profiles of Greek moldings, and carried decoration to a point of unrivaled magnificence. Such were their temples at Baalbek and Palmyra, and those of Castor and Pollux and of Faustina in Rome.

The Doric and Ionic orders of the Greeks were employed to a limited extent in a modified form. The Doric, for example, was thinned down to eight diameters in height and was given a base in addition to other minor changes in the entablature. The more elaborate Corinthian was, however, the favorite of the Romans, though two other orders, the Tuscan and the Composite, were also created and used. The Tuscan, which may have been derived from the Etruscans, was not used very frequently except in domestic buildings in superposed orders in which case it is the lowest. It is similar to the Doric but even more simple with a column seven diameters in height. At the other end of the scale comes the Composite which is even more ornate than the Corinthian. The cornice is enriched by a number of carved moldings, and the capital had the volutes and ovolo of the Ionic order superimposed on the bell-shaped form of the Corinthian with its two rows of acanthus leaves. But the great contribution of the Romans was their skill in planning immense buildings to give a monumental effect. The large halls of such structures as the imperial baths are admirably related to each other by a system of axes. Aided by their knowledge of vaulting and concrete, and the wealth of the emperors, the architects were enabled to produce the most magnificent spacious interiors that the world had seen up to that time.

The Pantheon is the noblest work in Roman architecture, but where the Romans excelled was in their theaters and amphitheaters, their fora and basilicas, their colossal baths and sumptuous palaces. Their triumphal arches set the model for all later generations. Monuments of the Golden Age bear eloquent testimony to the splendor and might of Rome. The ruined Roman cities of Asia Minor and Africa, such as the recent discoveries of Leptis Magna; impressive remains in France and Rhenish Germany; world-

famed ruins in Italy, such as those of Pompeii and Herculaneum, the amphitheaters at Casinum, Capua, Puteoli, and Verona, Hadrian's villa at Tivoli, the arch of Trajan at Benevento, the triumphal arches of Titus, Septimius Severus, and Constantine, the Colosseum, the Roman and imperial Fora, the immense thermal establishments of Titus, Trajan, Caracalla, and Diocletian, the sculptured columns of Trajan and Marcus Aurelius, the imperial palaces on the Palatine, the Tabularium, the Senate House, and the Admiralty (Neptunium), these are the chief among countless remains of a great historic past.

Sculpture.—In sculpture as in architecture, the Romans were the inheritors of Etruscan art and Greek tradition. But the Greek incentive—the decoration of temples—was lacking, and sculpture was for a long time represented by portrait statues of Roman citizens. These statues adorned the bridges, basilicas, baths, theaters, and other edifices of Imperial Rome; while the worship of ancestors called for many statues to set up in the houses, and to carry around in funeral processions. The only development which the Romans gave to the art was in the sculptured reliefs that adorned their architecture. Rome was filled with the art treasures of conquered Greece. Pasiteles, Stephanus, Menelaus, Arcesilaus, and other Greek artists flocked to the Imperial City, and found ready patronage among a luxurious people. The matter-of-fact character of the Roman patrons resulted in the displacement of the ideal treatment of the earlier Greeks by a bold, sensual, and above all, purely realistic treatment which appears most strongly in the portraits, but is obvious in all their work. This led to the idea of illusionism in reliefs in which by many sloping planes an effect of considerable depth is obtained as in the reliefs on the arch of Titus. The Romans also adopted the continuous method of narration in which one scene after another occurs in a given strip with no marked border between. The spiral reliefs of the columns of Trajan and Marcus Aurelius prove that perfect legibility can be attained with this method. With the wane of centralized power, Roman art declined; technique suffered too in the general dearth of creative talent. With the barbarian conquest of Italy, classical art came to an end.

Nimes, Maison Carrée.—A Roman Corinthian temple at Nîmes in southern France, and the most important Roman temple now remaining. It probably dates from the time of the Antonines. The building measures 45 feet by 85 feet, stands on a platform approached by 15 steps, and is surrounded by 30 columns. It is now used as a museum.

Pompeii and Herculaneum.—The two ruined cities of Italy which were overwhelmed by the eruptions of Vesuvius in 63 A. D. and 79 A. D. The ruins of Herculaneum were accidentally discovered about 1710, and excavations have been carried on, more or less intermittently, since 1737. As modern villages are built on the site of the ancient city, excavations can be made only by tunneling. The work of excavation at Pompeii was begun by King Charles III. of Naples in 1748, but not until 1860 was the work carried on systematically. The discoveries have thrown a flood of light on Roman art and customs. Temples, monuments, various civic buildings, statues, paintings (over 3,500 have been found in Pompeii), vases, bronzes, and marble tables, domestic utensils, articles of furniture and adornment, all have been discovered and mostly in a perfect state of preservation, affording a vivid picture of provincial life in the first century of the Christian era.

Rome, Arch of Constantine.—A triumphal arch near the Colosseum in Rome, erected in 312 A. D. by Constantine the Great to commemorate the victory over Maxentius. There are three arches and an attic supported by four piers, in front of which are Corinthian columns. It is partly adorned by sculptures taken from earlier monuments. It was restored in 1731.

Rome, Arch of Septimius Severus.—A triumphal arch in Rome at the northwest end of the Forum, erected in 203 A. D. to commemorate the conquest of the East by Septimius Severus and his sons, Caracalla and Geta. It has three direct arches and one transverse arch.

Rome, Arch of Titus.—A triumphal arch on the Sacred Way in Rome, erected by Domitian (81 A. D.) in commemoration of the conquest of Jerusalem. Its reliefs, representing the victory of Titus, show the Roman soldiers carrying the spoils of the temple, including the seven-branched candle-stick, the table for the shewbread, and the golden trumpets. The arch was taken down and rebuilt in 1822 to insure its safety.

Rome, The Colosseum.—The amphitheater was designed by the Romans for exhibiting gladiatorial combats, wild beast fights, and other spectacles. The Colosseum is the largest Roman amphitheater known, and stands on the site of Nero's palace in Rome. It was begun by Vespasian in 72 A. D. and finished by Domitian in 86 A. D. A fourth story was added by Severus Alexander (died 235 A. D.) and Gordianus (died 238 A. D.). It covers five acres of ground and its seating capacity is variously estimated at from 50,000 to 87,000 besides standing room for about 20,000 more. Externally, the Colosseum has four stories, the three lower with arcades—the lowest Doric; the second Ionic; the third and fourth Corinthian—according to the general Roman usage. Its height is 157 feet. The seats were of marble, the exterior walls and the chief corridors of travertine, the inner walls of tufa and concrete. There were four tiers of seats corresponding to the four stories. The arena measured 280 by 176 feet, and underneath were dens for wild beasts with appliances for hoisting them to the arena. Early Christians were frequently thrown to the wild beasts in this same amphitheater; one of the first of such martyrs being St. Ignatius, who was torn to pieces by lions. The Colosseum was chiefly destroyed in the fifteenth century when it was being used as a quarry for marble and other building materials. An end was put to the spoliation by Pope Benedict XIV. (1740–1758), who consecrated it as a monument to the Christian martyrs who had been persecuted within its walls.

Rome, Column of Marcus Aurelius.—A Roman Doric marble column on a square pedestal. It is now surmounted by a statue of St. Paul which Pope Sixtus V. placed there. The original column, 123 feet high, was erected to commemo-

rate the victories of Marcus Aurelius over the Marcomanni.

Rome, Column of Trajan.—A famous column at Rome erected in 114 A. D. in honor of the emperor Trajan. This noble masterpiece was constructed by the architect, Apollodorus. The pedestal is covered with warlike designs in bas-relief, while a similar decoration representing the victories of Trajan form a spiral round the shaft. These are all well preserved and form a valuable record of ancient costumes. In the interior of the column a spiral staircase leads to the summit of the column, which was originally crowned by a statue of Trajan, but this has been incongruously replaced by one of St. Peter. The height of the column is 132 feet.

Rome, Mausoleum of Hadrian.—This great structure, on the right bank of the Tiber in Rome, was erected in 136 A. D. in memory of the emperor Hadrian. Upon a base 247 feet square was built a circular mass of masonry 230 feet in diameter. The tomb was adorned with marble statues and surrounded by a bronze railing ornamented with gilded peacocks, two of which are now in the Vatican. The reconstructed remains of the mausoleum are now known as the Castel Sant' Angelo.

Rome, Palace of the Caesars.—The term is given to the buildings on the Palatine Hill at Rome, where Augustus first erected his palace on the site of the houses of Cicero and Catiline, succeeding emperors making alterations and additions. The ruins cover an area of 1,500 feet in length and 1,300 feet in breadth. The "Golden House" added by Nero, was of imposing grandeur. It was surrounded by a triple portico a mile in extent, and supported by a thousand columns; and within this was a picturesque lake bordered with stately buildings, each representing a miniature city. A statue of Nero, 120 feet high, stood in the main vestibule.

Rome, Pantheon.—The first Pantheon ("Temple to all the gods") was erected by Valerius of Ostia for M. Vipsanius Agrippa in 27 B. C. It was damaged or destroyed, and Hadrian replaced it in 123 A. D. with the present circular edifice, which is still well preserved. The walls are of immense thickness. The rotunda is 142½ feet in internal diameter and supports a cupola which rises to a height of 142 feet. The one window is circular, 27 feet in diameter, and is in the vault. Since 608 A. D. the Pantheon has been a Christian church, and is known as the Church of Santa Maria Rotunda. The term Pantheon has been applied to a number of domical structures, chief of which is the Church of Sainte Genevieve at Paris, erected 1764–1781.

EARLY CHRISTIAN AND BYZANTINE ART AND ARCHITECTURE

The earliest churches of which we have any record were built in the time of Constantine, who, in 313 A. D. was the first to sanction Christian buildings, and so give an impulse to Christian architecture. Unlike the pagan worship, which was chiefly in the open air, the new religion necessitated large interiors to accommodate large assemblies; hence was evolved the style known as basilican, adapted from the architecture of the Romans. This was the distinctive style of the earlier Western or Latin church, and passed from Italy northward with the spread of Christianity. After the eighth century, it was gradually superseded by the Romanesque, and then by the Gothic.

The basilican church consisted of three, and occasionally five, aisles, divided by columns. The aisle and nave were used by the laity, while the lower clergy found their place to the east end in the transept or bema, a member going at right angles across the aisles and nave. To the east of this again was the semi-circular or polygonal apse in which the altar was frequently, though not always, placed, and which was reserved for the higher clergy. The upper part of the nave, called the clearstory, rose high above the side aisles. The ceilings were flat, surmounted by a low gable roof. Below the clearstory was an unlighted space, the triforium, corresponding to the pent roof over the aisles. Finally below this came the colonnade which divided the nave from the side aisles and which at first carried a flat lintel but later a series of arches. Three enormous churches of this type were erected in Rome by Constantine or shortly after his death, namely, those of St. John Lateran, St. Peter, and St. Paul Without the Walls. The last named is a surviving monument, while in the desert cities of Syria and North Africa are preserved some interesting remains of this style of architecture.

In the East, Christian architecture developed into the Byzantine style, which differed from all earlier forms in its exclusive adoption of vaulted roofs, its rejection of timber, and its substitution of brick for the concrete of the Romans. The solution of placing a dome over a square plan by means of pendentives, or corbelled squinches, wrought a revolution in architectural design, the rest of the structure being subordinated to this dominant feature. The oriental love of color was a characteristic of this style, and the interiors were resplendent with rich mosaics and ornate decorations. The Byzantine style reached its perfection first in the reign of the emperor Justinian whose interest in the church of Hagia Sophia in Byzantium (Constantinople) was largely responsible for its magnificence. Other important churches of the time were St. Irene, and S. Sergius and Bacchus. In the ninth century, beginning with Basil I., a great revival of all the arts took place in Byzantium, resulting in a second wave of church building. The most famous church from this period is that of S. Marks in Venice, where the Eastern influence in artistic matters had long been predominant. It is important to observe that this church is not typical of the second Byzantine period. It still is the distinctive style of the Eastern church, and is prevalent in Russia, the Balkan states, and Asia Minor; from there it spread to Italy dominating Venice and Ravenna, and the South. Though a number of ecclesiastical monuments still remain, few secular examples are in existence; of these the oldest Venetian palaces are thoroughly representative of Byzantine art.

The iconoclasm that characterized the sixth, seventh, and eighth centuries of the Christian era had a calamitous effect on Byzantine art,

especially sculpture and painting; hence few remains have come down to us. The most notable examples of Byzantine figured sculpture are the colossal bronze statue (now in Naples) of the Eastern emperor, from Barletta, the *Madonna* in the cathedral at Ravenna, the reliefs of Christ at the Eski-Djouma mosque in Constantinople, and certain reliefs at the Mount Athos monasteries.

Constantinople, Church of Hagia Sophia.—The original church was built by Constantine, probably on the site of an old pagan temple of Athena, and was dedicated to Hagia Sophia or the Divine Wisdom. The Nika sedition in 532 A. D. destroyed the previous church, thereby giving the Emperor Justinian and his architects, Anthemius of Tralles, and Isidorus of Miletus, their opportunity. In the remarkably short space of six years the present edifice was completed. The central feature is a dome of 107 feet diameter rising to the height of 180 feet. The long axis of the church is emphasized by half domes to the east and west which serve to buttress the main dome, while on the north and south huge masses of masonry have the same function. The interior was provided with a wealth of rich mosaics and costly marbles gathered from all over the Mediterranean region. These create an indescribably rich effect of color while the height of the dome and the soft light from the row of windows at its base give the visitor an inspiring feeling of airy spaciousness. Like the Early Christian basilicas, Hagia Sophia originally had an open court, the atrium, in front, but only the porch or narthex is now preserved. The main dome collapsed in an earthquake in 558 A. D. but was replaced by 562 A. D. When the Turks captured the city in 1453, the church was converted into a mosque, but contrary to a prevailing opinion, they have taken good care of the structure, though the relics and Christian mosaics were profaned or concealed by whitewash. It was renovated in 1847–1849.

Rome, Catacombs.—The groups of subterranean vaults and labyrinths on the Via Appia near Rome are practically the only Christian remains of the first three centuries. It is believed these underground chambers were the meeting places of the early Christians in times of persecution, as well as their burial place. The Roman catacombs consist of long, narrow galleries and chambers cut out of the soft tufa. Some are near the surface, but beneath these are other stories to a depth of seventy feet. Though the superficial area of these catacombs is little over 600 acres, it is estimated that if the galleries could be arranged in a continuous line, they would stretch a distance of 545 miles. Niches or ledges were cut out of the rocky sides to form a resting place for a corpse, each niche being closed with a marble or terra cotta slab on which was inscribed the name of the deceased. The catacombs at Naples are similar to those at Rome, and are covered with Christian symbols as well as relics of pagan art. Many of the frescoes at Naples are distinctly classical in design, while in the catacomb of St. Practextatus, Hermes is represented as the conductor of the dead. The frescoes are for the most part devoted to Scriptural subjects. Similar catacombs have been discovered at Palerino. Syracuse, and Chiusi, as well as in Greece, Asia Minor, Syria, Egypt, Peru, and elsewhere.

Venice, St. Mark's.—The church of San Marco, modeled on its prototype, the church of the Holy Apostles in Constantinople (now destroyed), is the most magnificent example of polychromatic architecture in the world. It was built in 830 A. D. to receive the relics of the apostle Mark, the patron saint of Venice, and rebuilt in 1063 A. D. after a conflagration. From the eleventh to the fifteenth centuries a number of alterations were made till it assumed its present form. The church is cruciform with five massive domes on pendentives and several smaller domes in subordinate positions. The four famous bronze horses set above the central porch originally came from Constantinople. The interior of the church with its soft dim light, its richness and harmonious detail, its idealistic designs and the consummate blending of various styles, and its splendid Byzantine mosaics, is one of the most impressive in Europe. The description of St. Mark's in *The Stones of Venice* by Ruskin will be remembered by all lovers of art.

SARACENIC ARCHITECTURE IN THE WEST

The Moslem religion, founded by Mahomet in 622 A. D., quickly spread over East and West from its center in Arabia; Syria, Egypt, and North Africa being subdued in the seventh century; Sicily and Spain in the eighth. Although they preferred to adopt the native style rather than to introduce new ones, they left their peculiar flavor on whatever buildings they touched. The most important type evolved by the Saracens was the mosque which is generally rectangular in plan. Much of the area is occupied by an open court surrounded by arcades and with a fountain in the center sheltered by a pavilion. The rest of the work is a colonnaded hall, often very extensive. Slender towers called minarets rise from the corners of the rectangle. Other buildings like palaces show the influence of the climate and of the oriental love of seclusion by small windows and delicate grills. The pointed horseshoe and scalloped arches are regularly employed. Few moldings are to be found, but arabesques replace them. The latter, because of the religion, exclude natural forms, but an inconceivable richness of color and geometric patterns is obtained. The decorative Arabic script is frequently used. Domes and other types of vaults may have been inspired by the Byzantines. A peculiar form is the stalactite vault-like rows of small niches rising above each other and each row projecting beyond the lower row. In general, the style in the interior is more one of rich, colorful decoration than structure, tending to intricacy instead of simplicity.

Cairo, Mosque of Amr.—Founded by the caliphs, Abd-el-Melik and Walid, in 642 A. D. The large court is about 250 feet square. As is frequently the case in Early Christian art, columns are taken from Roman and Byzantine buildings.

Cordova, the Great Mosque.—Built in 786 A. D. by the Caliph of Cordova, Abd-el-Rah

man. A rectangular plan 570 feet by 425 feet. The covered portion alone, whose roof is supported by about 1200 columns of varied costly stones, covers a greater area than any Christian cathedral, but the height is only 30 feet to 65 feet. The interior, decorated in part at least by Byzantine craftsmen, is aglow with fine color in mosaics, marbles, gold, and semi-precious stones. It was once lighted by 800 silver lamps. After the capture of Cordova (1236), it became a Christian church.

Granada, the Alhambra.—In order to impress the conquered country with his power, this magnificent palace, one of the best monuments of Moorish architecture, was built by the Caliph Abd-el-Walid from 1309–54. The two main parts are the Court of the Lions and the Court of the Myrtles. The former derives its name from the fountain supported on the backs of twelve lions. The lovely Court of the Myrtles includes a large pool which faithfully reflects the surrounding architecture. The Hall of Judgment has stalactite vaulting as have several other rooms in the palace. Some of the ceilings are of cedar inlaid with mother-of-pearl, silver and ivory, and the decorative scheme of the palace, though carried out in colored plaster designs, is sumptuous to a degree and inclines to astonish the spectator by the appalling magnificence of the whole and by its beauty of details.

Jerusalem, the Dome of the Rock.—The so-called "Mosque of Omar" built in 688 A. D. occupies a site made sacred long before. The most famous previous building on the same location was the temple of Solomon. For Moslems, the site is made sacred because Mahomet is supposed to have ascended to heaven from the rock which has been sheltered for that reason. Certain columns in the building are fragments of late Roman work with Byzantine capitals. The decoration of the exterior by Persian tiles, and of the interior with marble slabs is due to the Turkish sultan, Suleiman the Magnificent, in 1561.

Seville, the Giralda.—This magnificent Moorish tower, erected in 1139, has been somewhat marred by the Renaissance belfry added to it in 1568. The Saracen portion, 45 feet square and 185 feet high, has received the typical Moorish wealth of decoration with scalloped, pointed, and horseshoe arches, interlacing arcades, arabesques, and so on, producing in this instance a design of the greatest beauty.

ROMANESQUE ART AND ARCHITECTURE

This style came into being and flourished in the eleventh and twelfth centuries in Europe. In it we find a number of schools differing widely from one another, but showing for the first time a trace, still very faint, of national differences. The style is generally characterized by the use of massive construction and the round arch. Two broad divisions of the various styles of Romanesque may first be established—the organic and the inorganic. The term organic applies to a vaulted architecture whose structural forces are visibly concentrated and logically resisted. It therefore amounts to revealed structural logic in a vaulted building. It should be observed that the two terms are purely descriptive, and do not confer either commendation or opprobrium on a building.

The inorganic styles may be mentioned first. These probably appeared simultaneously in many parts of Europe. In Central Italy the Tuscan style is characterized by a simple, light structure similar in disposition to an Early Christian basilica. In the cathedral group at Pisa or the Baptistry in Florence, its classical borrowings, as so frequently in Romanesque, are marked. The buildings are characterized by the lavish use of arcades and polychromatic effects. The South of Italy shows its historical background in borrowing detail from the Norman conquerors, slightly pointed arches from the Saracens, and brilliant mosaics from the Byzantine, as well as certain elements from the Romanesque of Lombardy and from classical antiquity. The cathedrals at Monreale and Cefalu, and the church of San Nicola at Bari are typical. Provence, in the south of France, shows the influence of the fine remains of Roman architecture in which the district abounds, as in St. Trophime at Arles. In Acquitaine and Poitou the Byzantine domes on pendentives seen in St. Front at Périgueux combine with façades lavishly decorated with small scale sculpture and ornament, especially a pattern resembling fish scales, at Angoulême Cathedral or Notre Dame la Grande at Poitiers. Burgundy is semi-organic in feeling, with experiments in many types of vaults, such as round and pointed barrel vaults, barrel vaults set at right angles to the long axis of the church, and groined vaulting. Sculpture is lavishly used around the portals of churches. The great abbey at Cluny, now destroyed, and the Church of the Madeleine at Vézelay were among the most famous in Europe.

Probably the first of the organic styles to develop was that of Lombardy in North Italy. Here was evolved the domical groined vault carried on ribs. Six ribs constitute the full complement. The square area of the vault is bounded by two ribs running along the side of the nave known as wall ribs, two crossing the nave called transverse ribs; and two diagonal ribs which divide the square into four triangular compartments. This general rib system persists in later organic Romanesque, and was passed on to Gothic. In the Lombard style all the ribs are semi-circular. Because the length of a diagonal is greater than that of the sides of a square, the diagonal ribs rise higher than either the wall rib or the transverse ribs producing a domical result. The lateral thrust of such a vault is transferred across the gallery over the aisle to the outer wall of the church. Hence no clearstory is possible. The pier to support such a vault is composed of a number of shafts corresponding to each of the ribs of the vault, and facing in the direction of the rib to which it corresponds. Finally, since there were two small vaults in the aisle to one large vault in the nave, we find small piers supporting only the vaults of the aisle alternating with larger piers which carry the vaults of both the aisle and the nave. This produces a rhythm down the nave of the church and is a logical revelation of the structure of the building. Good examples may be found in the churches of Sant' Am-

brogio at Milan and San Michele at Pavia.

The organic Romanesque of the Rhine valley became the national style of Germany. Though a loss of logic results from the elimination of some of the ribs or of some members of the pier, such cathedrals as Mainz, Speyer, and Worms attain a strong monumentality with dignity and grandeur. Normandy continued to develop further structural innovations. Instead of the domical vault of Lombardy, diagonal arches of elliptical form made possible a vault with level crowns. The quadripartite vault is complicated by the addition of a third transverse rib bisecting the two sections of vaulting next to the wall of the church. Among the best examples are the two abbeys at Caen. This style reached its culmination in the Romanesque of England, sometimes called the Anglo-Norman style. Here massive walls and great solid piers create an atmosphere of sedate grandeur, though there is less organic feeling than in the pure Norman of the continent. Most English cathedrals show some portions in the Norman style as in Ely, Norwich, Gloucester, Rochester, Canterbury and Peterborough, but the best and most complete example is Durham Cathedral.

In the sculpture of the period, naturalism finds no place. The Byzantine ideals were spread in Europe by means of manuscripts and ivories, and the hieratic, symbolic spirit of the East is echoed again in the West. Fine architectural feeling and monumentality of effect are produced by these means. The school of Languedoc in Southwestern France is among the most influential. Although completely unrealistic, a certain liveliness is attained by animated postures. One regularly finds the drapery treated in repeated, formal lines ending in zigzag folds of a decorative effect similar to archaic Greek art of the Ionic school, as in the tympanum of the church of St. Pierre at Moissac. The portals in Burgundy exhibit extremely attenuated forms and intricate conceptions, but with no less splendid decorative and architectural effects, illustrated by the Church of the Madeleine at Vézelay or in St. Lazare at Autun. Provence shows a marked classical feeling in the stocky figures with large heads which have the dignity and strength of Roman works even if they lack the delicacy of Languedoc and Burgundy. Such work may be seen at its best in the portal and cloister of St. Trophime at Arles. The production of Northern Spain is closely akin to that of Languedoc and may even deserve priority in the field. The earlier work may be seen in the Puerta de Platerias, while the Portico de la Gloria, also at Santiago de Compostela evinces an influence from Burgundy and Languedoc.

Caen, Abbeys.—A pair of churches founded by William the Conqueror and Matilda, his wife, daughter of Count Baldwin of Flanders, in expiation for their marriage. Inasmuch as the two were relatives, this union would normally have been forbidden by the church. St. Etienne, called the Abbaye aux Hommes, was begun in 1064 though the sexpartite vaults were not added till about 1135. Ste. Trinité, the Abbaye aux Dames, was two years older than its companion, but received its present vaults a few years after the other church. In general, though less logical, the proportions of Ste. Trinité are somewhat finer than those of St. Etienne, and exhibit an almost feminine grace as compared with the virility of the Abbaye aux Hommes.

Cluny, Abbey.—The great mother church of the Cluniac order. Founded 910, but important rebuildings took place from 1088–1110 and subsequently. The church was the finest example of Burgundian Romanesque with a long nave still further increased by an ante-nave of the late twelfth and thirteenth centuries. The church was sold for building materials at the time of the French Revolution, though it had remained in almost perfect condition down to that time. Parts of the monastic buildings have been preserved, and are now in use for other purposes. The whole site is being thoroughly investigated at present by Professor Conant of Harvard university.

Durham Cathedral.—The most complete large example of English Romanesque. The building was begun in 1093 by William of S. Carilef who completed the east side of the transepts and the choir which originally had three apses. The nave and transepts are due to Bishop Ralph Flambard's building campaign from 1099–1128. His work is more developed than the earlier style, but less so than that used under Bishop Pudsey from 1153–95, during which period the vault was probably erected as was the Galilee porch. For the rest, the apses at the east end were converted into the chapel of the nine altars in the Early English style of the thirteenth century; the tower is fifteenth century perpendicular Gothic; the refectory is seventeenth century; and the whole has suffered somewhat from unfortunate restorations by Wyatt and Sir George Gilbert Scott. The fine location above the banks of the Wear river makes the superb pile doubly impressive.

Ely Cathedral.—The Bishops of Ely and Durham were the most powerful of the English ecclesiastics in the middle ages in secular affairs. The present church was begun in 1081 by Prior Simeon, and the nave and western tower were completed under Bishop Reddell at the end of the twelfth century. The choir is Early English, and the octagon over the crossing is Decorated. The magnificent form of the latter is due to its architect, Alan of Walsingham, and is unique. The uninterrupted length of the church is 520 feet. Its bulk rising far over the surrounding country has earned the title of the "ship of the fens."

Monreale Cathedral.—This building, the best of Sicilian Romanesque, was founded by William the Good in 1176. The exterior of the east end is richly treated with interlacing arcades of pointed arches creating an indescribably gorgeous effect. The towers of the west end are an instance of Norman influence. The interior of the church is resplendent with polished marble in the lower story, and the whole wall surface of the upper portion including the soffits of the arches and the jambs of the windows are covered with an incrustation of mosaic. The subjects are taken from the *Bible*. In the semi-dome of the apse appears Christ as Judge of the World, a stern conception akin rather to the *Old Testament* than to the *New*. The beautiful cloister is composed of arcades of pointed arches

supported by paired colonnettes which are enriched by carving or mosaic inlays.

Pisa, Cathedral Group.—The Pisan victory over the Saracens and the capture of Palermo in 1062 provided funds with which to erect a great cathedral. This was begun in 1063 by the architect Boschetto who may possibly have been a Greek. The church is basilican in construction with Corinthian columns, but the wide transepts and the dome over the crossing are perhaps due to Lombard influence. The famous Leaning Tower begun in 1174 uses again the motive of repeated arcades which make the Cathedral itself noteworthy. The foundations have sunk so that the tower leans 14 feet to one side. This settlement had already begun when the tower was in process of construction, and attempts to correct this inclination were made. The baptistry in front of the Cathedral was begun in 1153, but the original scheme was most unfortunately altered in the Gothic period. It houses the famous pulpit of Nicola d'Apulia, executed in 1260. The group was completed with the erection of the Campo Santo during the Gothic Period. Its walls are decorated with frescoes by such men as Benozzo Gozzoli. The *Triumph of Death* by a Sienese follower of the Lorenzetti brothers is the most famous.

Santiago de Compostela, Cathedral.—In the middle ages the three most important pilgrimages were the Holy Land, Rome, and the shrine of St. James at Compostela where the bones of St. James the Major were supposed to rest. The latter pilgrimage was fostered by the Cluniac order, and along the route there were a number of churches of a design so similar that they must have at least influenced one another. The church of St. James at Compostela begun in 1078 was the most important. The style is characterized by broad transepts, the barrel vault of the nave supported on transverse arches, and groined vaults in the aisles. Other important members of the group were S. Sernin at Toulouse and S. Foy at Conques, while those of S. Martial at Limoges and S. Martin at Tours are now destroyed. The façade of the cathedral of Santiago de Compostela is baroque by Fernando Casas y Novas. This church is 308 feet long, and 207 feet wide across the transepts. The Puerta de Platerias and the Portico de la Gloria exhibit some of the finest extant sculpture of their respective periods.

GOTHIC ART AND ARCHITECTURE

It is said that the term "Gothic" was first applied to this style of architecture by Raphael in a report to Leo X., concerning some projected building in Rome. It was meant to convey the idea of barbarous as opposed to Roman. The name is misleading, for the style did not originate in Germany as the name implies, but in France. Some have tried to substitute "Pointed Architecture," but that is insufficient, for the use of the pointed window is only an incident, and not a fundamental characteristic. Others have used the term "French Art" but to convey the exact idea, one must add "of the last third of the Middle Ages" which makes an unwieldy name. It seems therefore that the error must be perpetuated. The strongest impressions which a Gothic building conveys are those of height and lightness. Such a building seems to be made up of windows, rose-windows, pinnacles, and lace-like traceries of stone. Vertical lines and pointed arches abound. The flying buttress is peculiar to Gothic architecture. The added height of the walls, and the additional weakening of them by the use of many and large windows, required that they be reinforced from the outside by means of stone arches supported by buttresses designed to carry the lateral thrust of the lofty interior vaults.

The essential problem of Gothic builders in France was to transform the rigid, rather heavy Romanesque vaults into lighter construction, and to concentrate the thrusts of these vaults at small isolated points in the wall which could easily be met by a flying buttress. By a series of perfectly logical steps which can be traced in detail, an oblong form of vault with level crowns was evolved. The logic of the French mind reveals itself in the manner in which the vault itself is reflected in the membered pier, and indeed in most of even the smaller elements of the building, which were first designed to be satisfactory from a structural point of view, and then were made beautiful. Everywhere in the great French Cathedrals, the structure is revealed. The period of cathedral building in France was brought to an end by the political disturbances of the Hundred Years' War, but in the fifteenth century, a new style, the Flamboyant Gothic, was evolved. At this time, exuberant architectural decorations freely using the flame-like reversed curve in its tracery was combined with extremely light construction and astonishing technical skill. Although no large cathedrals were undertaken, most of the earlier buildings show the Flamboyant style in part, and thousands of small churches attest the vigor of the time.

In England, Gothic architecture developed on distinct lines, while retaining some of the features of the traditional Norman style. The Early English or Lancet style, so named from the shape of the windows, was marked by simplicity and sparing use of buttresses. The choir of Canterbury cathedral, and the cathedrals of Salisbury, Lincoln, Lichfield, and Wells are notable examples of this style. This period was followed by the Decorated (1280–1400), which is distinguished by profuse ornamentation and lighter construction, as illustrated by the cathedrals of Winchester, Exeter, York, and Carlisle. The Perpendicular style extended to the middle of the sixteenth century, when it became known as the Tudor. Its main features were the vertical character of the buildings, and an elaborate system of vaulting, particularly fan-shaped vaulting. Many of the college buildings at Oxford and Cambridge are representative of this style; so also are St. George's Chapel, Windsor, and the chapel of Henry VII., in Westminster Abbey. Towers and spires were always characteristic of English Archiecture, and attained their greatest perfection in the fifteenth century.

Sculpture was more and more introduced into the decorations of Gothic structures, the use of statuary reaching its climax in the thirteenth century. In France exteriors were lavishly ornamented, and still further to accommodate such

ornamentation, portals were developed into porches. Although no interest in the nude is manifested, the nobility of conception, the marked idealization, and the ability to adapt the sculpture to the lines of the building deserves favorable comparison with the glories of Parthenon at Athens. In the fourteenth century, sculpture was dissociated from the building, and a tendency to extreme elegance appeared, whereas in the fifteenth century, the realistic development sometimes attained such monumental results as the figure at Champmol near Dijon by Claux Sluter. English Gothic did not lend itself so well to sculpture and the moist climate has seriously damaged much of the carving that was done. However, the German work of the fifteenth century in bronze, and especially in wood carving, attaind perhaps the highest technical facility that the western world has seen coupled with strength, originality, and splendid regard for the possibilities of the material. Such names as Veit Stoss, Adam Krafft, Tilman Riemenschneider, and Jorg Syrlin from various parts of the Germanic lands will always be remembered with honor by woodcarvers. In Italy the sculpture of this period at first is of a different character. The style of Nicola d'Apulia shows such marked affinities to Roman work in its massiveness and features that one must conclude a considerable acquaintance and sympathy with the extant monuments of antiquity. He seemed to foretell a revival of interest in the past which was submerged by the wave of Gothic influence from France which made itself felt in his son Giovanni Pisano and which persisted through the fourteenth century in the works of Andrea Pisano, Giotto, Orcagna, and Lorenzo Maitani.

Albi Cathedral.—The town was, as its name indicates, a center of the Albigensian heresy. After its suppression by a crusade the cathedral of Ste. Cécile was erected, 1282–1397. This splendid edifice is a fortified church with windows far above the ground, battlements, and the lower part of the wall is of battered construction. The church has the normal side aisles replaced by chapels on either side. The nave is one of the widest single spans in Europe. The choir screen and the porch are fine examples of Flamboyant Gothic.

Amiens Cathedral.—The largest ecclesiastical edifice in France, and one of the finest specimens of Gothic Architecture in Europe. It was begun in 1220, and finished in 1288. While many additions have since been made, the two side towers of the western façade are unfinished. It is 470 feet long, the transept is 213 feet long, and the nave is 144 feet wide. The very slender spire over the crossing is 360 feet high.

Beauvais Cathedral.—Only the choir and transepts of this project were carried out. The present nave, called the Basse Oeuvre, is a modest Romanesque structure which was being replaced by the Gothic building founded in 1225. The vaulting of the choir rises 157 feet above the pavement, the loftiest of all Gothic vaults. The transepts were not completed till the sixteenth century. At the same time, a spire almost 500 feet high of light construction partly in wood was erected over the crossing, but owing to lack of abutment where the nave should have been, the tower fell in 1573, only four years after its completion.

Bourges Cathedral.—Begun in 1193, this building is an example of a five aisled church. The lofty piers of the nave and the narrow aisles are extremely impressive. Around the five doorways to the west end of the church, much fine Gothic sculpture is to be seen, and the interior contains some of the best stained glass of the thirteenth century.

Burgos Cathedral.—Founded in 1221, this magnificent structure was due in large part to an English and a German bishop, but retained a Spanish flavor nevertheless. The interior, 300 feet long, is mostly of the thirteenth century, and is flanked with rich chapels. The spires of the exterior betray their German origin in the open work tracery of which they are composed, while the florid lantern is supported on a star shaped pattern of ribs.

Canterbury Cathedral.—Founded in the eleventh century, the choir was greatly enlarged in 1174 and was one of the first examples of the Gothic style in England. This is raised several feet above the nave and separated from it by a fifteenth century screen. The building is long and narrow; the interior is high and impressive; it is 514 feet long, and 71 feet wide. The vaulting of the nave is 80 feet high, and the great central tower, dating from the fifteenth century, is 235 feet high. Some of the glass in the choir dates from the thirteenth century.

Chartres Cathedral.—This very old site in all probability has been steadily in use during pagan times, but the present building was begun in 1120. Most of the twelfth century church disappeared in the disastrous fire of 1194, but parts of the façade including the old sculpture, the southern tower, and the lower part of the north tower show the earlier work. The sculpture of the west front is the best example of the transition from Romanesque to Gothic having stylized treatment which reflects perfectly its architectural lines. The thirteenth century interior has some 160 stained glass windows, the most beautiful and complete set in Europe.

Cologne Cathedral.—One of the great buildings of the world; begun in 1248, completed in 1880, after being neglected from the fifteenth century until 1823. It was suggested by the Cathedral of Amiens. The building has double aisles, with two enormous towers and spires at the west end. The vast cathedral loses a great deal of its immensity by the dominating size of the towers. It is 468 feet long and covers 91,464 square feet. The spires are 512 feet high and are surpassed only by those of Ulm.

Lichfield Cathedral.—A large and impressive church dating from the thirteenth century, and one of the most beautiful ecclesiastical buildings in England. Its proportions are exquisite and its ornamentation is of great beauty. It has three lofty spires, the central one being 260 feet high.

Lincoln Cathedral.—This grand building was founded in the eleventh century and rebuilt in the end of the twelfth and the beginning of the thirteenth centuries. It is an example of the thoroughly English Gothic style, showing no trace of the French influence so noticeable in

Westminster Abbey. It has three square towers. The central one is 262 feet high, the two on the west front are 200 feet high. The choir, with its decorated screen, is Early English, except the five bays, called the Angel Choir from its reliefs in the spandrels of the arches of the nave arcade; this is one of the best examples of the Decorated period. The building is 430 feet by 80 feet, and the height of the vaulting in 82 feet.

London, Westminster Abbey.—Founded on the site of an earlier church by Edward the Confessor, and rebuilt in the thirteenth century by Henry III. and Edward I. Early in the sixteenth century the chapel of Henry VII. was added. Including the chapel the building is 513 feet long and 75 feet wide; the transepts are 200 feet long; the height to the vaulting is 102 feet. The three portals, graceful arcade, and large wheel window on the north transept façade are very fine. The square west towers were designed by Sir Christopher Wren. The Abbey is world-famous as the burial place of Great Britain's distinguished dead. The famous poet's corner is in the south transept. Here are found memorials to most of the great names honored in English literature, including a bust of Longfellow. The famous metal tomb of Henry VII. by Torrigiano is the most notable which the building contains.

Melrose Abbey.—This famous ruin on the Tweed, 29 miles from Edinburgh, dates from the fifteenth century. It is regarded as the finest ruin of Scotland. The choir is noted for its rich capitals. The large traceried windows are notable. A few of the bays retain their vaulting.

Milan Cathedral.—This famous building is of the Gothic Architecture, but the façade is marred by classic doors and windows, and the altars within are in the same style. The edifice is nearly 500 feet long, and 250 feet wide through the transepts, and the height of the nave is about 150 feet. The central spire is more than 350 feet high. The throng of statues (some 4,500 in all) and the many pinnacles are marked features of the exterior.

Paris, Cathedral of Notre Dame.—The famous cathedral church of Paris, situated on the site of a Roman temple on the Ile de la Cité. Though begun in 1163 it dates from the early thirteenth century. It is one of two or three of the finest examples of early Gothic architecture. It measures 156 feet by 420 feet and is 110 feet high. The two western towers are 224 feet high. The spire, erected in 1845 by Viollet-le-Duc, is 385 feet high. The cathedral became the "Temple of Reason" during the Revolution, and not till Hugo's *Notre Dame de Paris* had drawn attention to the venerable edifice was it restored (1844–45).

Rheims Cathedral.—Begun in 1212, it is noted for its vast interior (466 feet long and 124 feet high) of perfect symmetry and imposing majesty. Its gorgeous rose window is filled with exquisite amber-colored glass of the thirteenth century. Six hundred statues adorn the triple portal of the western front. Rheims was the coronation place of the kings of France from the earliest times down to 1830. The façade of the church is one of the finest produced in the Middle Ages. There were originally seven lofty spires, but these were destroyed in the fire of 1480.

Rouen Cathedral.—One of the most impressive in existence. It is 447 feet long, the nave is 92 feet high, and a tower, built to replace an old one struck by lightning, is of iron, 500 feet high. The front varies in date from the Romanesque to the Flamboyant Gothic. The fine rose windows and the sculpture about the rich gabled portals are remarkable. The whole building is noted for its lightness.

Salisbury Cathedral.—One of the most beautiful of English ecclesiastical structures, begun in 1220 and finished in 1260. The superb central tower with its spire is 406 feet high. The building is 473 by 99 feet, and the height of the vaulting is 81 feet. It is a consistent example of early Gothic.

Seville Cathedral.—This gigantic structure is the second largest church, in area, in the world, being surpassed only by St. Peters in Rome. The work was begun in 1402, and was continued throughout the century. The interior length is 380 feet, the width 250 feet. The five aisled plan of the church, the omission of an apse, and the rather flat roofs suggest an influence from Saracenic architecture which is made more likely since a mosque was long used as a cathedral by this city.

Strassburg Cathedral.—An interesting monument begun in the eleventh century, and finished in the fifteenth. It is famous for the spire,—468 feet high—the west front, very delicately and richly decorated with traceried windows and arcading, fine sculptured portals, and a magnificent rose window. The openwork tower is also remarkable. The nave is thirteenth century and 100 feet high. The east end is massive Romanesque. The glass is extremely gorgeous in color. The huge astronomical clock, conceived in the early part of the sixteenth century and rebuilt in 1842, is one of the great curiosities.

Ulm Cathedral.—A fine example of late Gothic in Germany; it is the largest church edifice in Germany excepting the Cathedral at Cologne. It was begun in 1377 and finished in the sixteenth century. The splendid triple portal at the west end, the tower terminating in an octagonal form, and the spire, which is 529 feet high, and the tallest church spire in the world, are the chief points of interest. The building is 420 feet by 165 feet and the height of the nave to the vaulting is 141 feet.

Venice, Doge's Palace.—Begun in 1309, the lovely exterior of this building is Gothic, and is nobly composed. Its use of color is typical of Venetian architecture. The interior has undergone many restorations during the period of the Renaissance of which the courtyard and the Giants' staircase are the most interesting. Within its walls, stunning decorations by such great Venetian painters as Tintoretto and Veronese may be seen.

RENAISSANCE ART AND ARCHITECTURE

The division known as the Renaissance in architecture is subdivided into three periods; the Early or Free Renaissance (1420–1500), the High or Classical Renaissance (1500–1575), and the Declining Renaissance or Baroque

(1575–1780). The style was a result of the study of classical models of antiquity and the effort to adapt the old styles to meet the new conditions. It was personal rather than national, decorative rather than constructive, and depended more than any previous style of architecture upon the individuality of the architect.

The architect to whom the credit for the start of this movement belongs is Filippo Brunelleschi who deserted the pointed arches, pinnacles, and tracery of Gothic architecture, which Italy had never really understood, in favor of the classic round arch, and horizontal lines, when in 1421 he designed the loggia of the Ospedale degli Innocenti in Florence. In his greatest works such as the church of San Lorenzo, the Pazzi Chapel, and dome of the Cathedral at Florence, he adopts the classic vocabulary completely, but not always correctly according to ancient principles. Furthermore, as indeed, throughout the period, certain structural innovations of the middle ages were employed, notably the dome on pendentives. Leon Battista Alberti, a great student of antiquity, directed architecture into more rigidly classic forms in Sant' Andrea at Mantua or in the Rucellai Palace in Florence in which the classic orders were for the first time applied to the exterior of a palace. Other architects of the fifteenth century were Michelozzo, B. Rossellino, G. da San Gallo, Amadeó, and Laurana.

The sixteenth century was ushered in by the highly classic work of Bramante, and adopted the more massive structure of the Romans, but even then kept the dome on pendentives. In spite of the purity of the period, a certain dryness and stiffness were apparent. Raphael, Perruzzi, Antonio da San Gallo, the elder, Antonio da San Gallo, the younger, Palladio, and Sansovino stand out in the high Renaissance. This period gradually changed, turning to greater freedom, an ideal which was stimulated by the example of Michelangelo himself. His forceful and restless energy made him prefer the colossal in design and made unendurable "the bonds and chains which architecture hath laid upon herself" for so he termed the rigid canons of classic art in vogue at that time. These he broke to suit his own sense of design in his work on St. Peters, Rome, or in the Farnese Palace. The freedom which he inaugurated grew steadily till the middle of the seventeenth century, reaching its height in Bernini and Borromini in architecture, and in the decorative extravagances of Gherardi, Pietro da Cortona, Fratel Pozzo, and other lesser men. This liberty in turn provoked a reaction in the eighteenth century to classicism once more in the works of Vanvitelli whose immense palace for the Dukes of Naples at Caserta is one of the most magnificent in Europe.

The ideals of the Renaissance were first adopted in France as a fashion by the aristocracy just as Gothic had been adopted in Italy. The slighter decorative features like moldings and arabesques were at first simply added to fundamentally medieval structures, producing the charming châteaux of Touraine. Under Henry II., a stricter classicism prevailed, due in part to certain minor Italians who were induced by royal patronage to make France their home. However, the great period of the French Renaissance in architecture did not occur till the disturbances caused by the wars of religion had subsided in the reign of Henry IV. This style was at first quite free, but gradually became more classic in tendency, reaching its climax at Versailles, built largely in the reign of Louis XIV. Here LeVau, Mansart, and other architects collaborated to produce an ensemble which expressed the formality, the power, the magnificence of the court of Le Roi Soleil. Other buildings designed by J. H. Mansart include the Dome des Invalides, and Marly. Among the other distinguished architects of the seventeenth century, Salomon de Brosse, F. Mansart, uncle of J. H. Mansart, and architect of the Sorbonne, the Val de Grace, and part of the Château at Blois, and Claude Perrault. Such a formal style could not but be modified during the freedom of the reign of Louis XV. when the rococo style came into being. The extremely freehand character of the style which delighted in eccentric forms was adapted to a lady's gilded boudoir, and in France may be said to have been confined to interiors, though in Germany, architects applied it to the exteriors with rather poor results. In the latter half of the century under the influence of new discoveries of classic antiquity made known by the publication of works on the Athenian Acropolis, Palmyra, Spalato, and above all, by the recent discoveries at Herculaneum and Pompeii, a more archaeological style began to come in, though at first this was free from the defect of dry imitations of antiquity. The work of A. J. Gabriel in the Petit Trianon at Versailles, the École Militaire, and the Place de la Concorde at Paris is supremely beautiful because of Gabriel's refined taste, his sense of proportion, and the extreme delicacy of all details. Other architects of the time, like Soufflot, tended to be a little more rigid.

In England the Renaissance did not arrive till the seventeenth century in the work of Inigo Jones whose purity was derived from a study of the precepts and works of Palladio. Christopher Wren dominates the field with the bigness and impressive quality of his work and with the evolution of the classic spire, an essentially Gothic element now translated, as it were, into Renaissance forms. In the eighteenth century the classic ideals of Palladio produced the Georgian style which was to be the basis of the American Colonial. Wood, Gibbs, and Vanbrugh are among the great architects of the period.

In sculpture, the Renaissance manifested itself by a return to nature. So we find the outworn conventions of late Italian Gothic supplanted by the fresh naturalism of a Donatello which places its emphasis rather on the Christian beauties of thought than on the classic beauties of the body. Nevertheless, nude figures do begin to come in as may be seen in the *David* of Donatello. So, too, does expression of emotion find its place in his work. The *Gattamelata* is the first large equestrian statue since antiquity. In fact, Donatello has the distinction of starting many of the lines of Renaissance work. More delicate work appears in such a man as Desiderio da Settignano whose child portraits will always charm, and his follower,

Mino da Fiesole, is sometimes over-refined and too subtle. Verrocchio sums up the fifteenth century, trying his hand at many of the subjects which Donatello had attempted and generally improving them slightly. His *Colleoni* in Venice is perhaps the greatest bronze equestrian monument in the world. Other sculptors of the period were Ghiberti, Jacopo della Quercia, A. Pollaiuolo, Ant. Rossellino, Amadeo, Bregno, and Laurana.

In the sixteenth century the classic ideas, as in architecture, became stronger, with the not infrequent result of cold and lifeless production. The greatest genius, however, of the period is not at all of this character. In the very first rank as poet, architect, and painter, Michelangelo accounted himself primarily a sculptor. His mind could conceive only such gigantic projects as the tombs of Julius II. which from the size of the original project was doomed never to be completed. The *Moses* and the *Bound Slaves* are parts of the scheme. The Medici Tombs in the sacristy of San Lorenzo in Florence interpret the soul of an almost medieval Christian and an ardent patriot, struggling with a pagan love of physical beauty, and weighed down by the corruption of the times, the subjugation of Florence, and the invasions of Italy. The colossal, sorrow laden, brooding forms of the *Day and Night, Twilight and Dawn* express his restlessness and his contempt for the times. Other works by him include the *Bound Slaves* of the Louvre, the *Pieta* in St. Peter's at Rome, and the *David* in the Academy in Florence. Among other men of the period may be mentioned Giovanni da Bologna, Jacopo Sansovino, and the goldsmith sculptor Cellini whose autobiography has long been a classic. As in architecture the greatest figure of the Italian baroque was Gian Lorenzo Bernini whose extravagant displays of religious ecstacy, whose pictorial sweeps of drapery, and whose theatricality can never disguise their technical merit or their splendid vitality.

In France the sculpture followed the same movements as the architecture, swinging back and forth from freedom to classicism. At the beginning, the extremely delicate and graceful work of Jean Goujon as in the *Fountain of the Innocents* at Paris suggests comparison with certain products of the height of Greek sculpture. The heavy classic work of Coysevox and the academic correctness of Puget reflect the period of Louis XIV. in sculpture as J. H. Mansart does in architecture. Pigalle, Falconet, Pajou, and Clodion reproduce the license, the sprightly gaiety, the boudoir character of the time of Louis XV. In Houdon, we find a portraitist of the very first rank, in that combination of the individual and general which results in a reproduction not merely of the subject's features, nor even the greater portrayal of the spirit, but of a type transcending the subject and even the time. Among his portraits were heads of Washington, John Paul Jones, and other Revolutionary characters.

Chihuahua Parish Church.—This, the most important building in the city, was erected between the years 1717 and 1789 by revenues derived from a tax on the silver output of the mine of St. Eulalia, amounting, it is believed, to $800,000. The most noticeable characteristics of the building are the sense of lightness and grace. This effect is secured largely by the unusual height in proportion to the width, not only of the main building but of the towers. The façade is richly adorned by statues of San Francisco and the twelve apostles.

Florence, San Lorenzo Church.—Begun in 1425 by Filippo Brunelleschi for the Medici family. The interior of the church, which is one of the earliest Renaissance examples, has an arrangement similar to that in the Early Christian basilicas. The new sacristy started in 1520 is the work of Michelangelo built for the second Medici pope, Clement VII. It contains the celebrated Medici Tombs of Giuliano de Medici and Lorenzo de Medici, with the figures of *Day and Night*, and of *Dawn and Twilight*. Parts of these figures were never completely finished which may enhance rather than detract from their restless power. The façade of the church has never been completed, though designs for it have been submitted by many architects including Michelangelo himself.

Florence, Santa Maria Del Fiore Cathedral.—Begun in 1296 by the Florentine architect Arnolfo di Cambio. The bulk of the church is Gothic in style. The tower beside the church is also Gothic, designed by Giotto, and decorated with sculptures in relief by Giotto and Andrea Pisano. The great dome over the crossing has a span of 138½ feet, almost as great as those of the Pantheon and the church of St. Peter's in Rome, and is by Brunelleschi, who was the first great Italian architect of the Renaissance. The dome is octagonal, built of two shells, the structure being inspired as in so much work of the early Renaissance by the medieval baptistry in front of the Cathedral. The building is 500 feet long and 128 feet across the nave and sides.

Florence, Palazzo Pitti.—A palace in Florence said to have been designed by Brunelleschi, though his connection with the building is doubtful, begun in 1435. The rear portion of the building was done over about 1560 by Ammanati to receive the Ducal family. It is now the repository of a world famous collection of paintings, and is connected by a very long passageway, which crosses the river Arno, with the Uffizi Gallery by Vasari which also houses a splendid collection of paintings. The Pitti Palace is built of quarry faced ashlar, and has a series of columns composed of blocks of stone alternately large and small.

Heidelberg Castle.—The most noteworthy example of the German Renaissance. It was founded in the thirteenth century by the elector palatine, Rudolph I. Two large wings, the Ottoheinrichsbau (1556–63) and the Friederichsbau (1601–07) are the parts coming from the Renaissance. The detail, inspired by the profusion of North Italy, is unrestrained, and lacks the beauty of its model because of its crude and coarse handling. The building has suffered much and was among the most impressive ruins in Germany. It is now being used for a museum and consequently is in better condition.

London, St. Paul's.—This great monument of the English Renaissance was begun by the architect Sir Christopher Wren in 1675 to re-

place the fine Gothic Cathedral which had been destroyed by the great fire of London in 1666. The church is in the form of a Latin Cross 514 feet long and 287 feet wide. The dome which covers the crossing is 102 feet in diameter, and rises 365 feet in the air, becoming a landmark for miles around. On the façade, we find a two-storied classic portico of Corinthian columns crowned by a pediment, and flanked by spires using classic detail. Much of the fine carving on the interior is by Grinling Gibbons. Wren is buried in the building with a single motto on his tombstone, "If you desire a monument, look around you." The cost of the whole building, which is of Portland stone, was nearly $4,000,000, being the proceeds of the tax on coal brought into the port of London during its erection. The great bell of this cathedral is tolled only on the occasion of a death in the royal family.

London, Whitehall Palace.—Originally built by Hubert de Burgh in the reign of Henry III., James I. undertook to rebuild it after its destruction by fire in 1615. Inigo Jones laid out a colossal plan for a new palace in 1619 of which one room only, the Banqueting Hall, was erected. This is 111 feet long, 55½ feet wide, and 55½ feet high. Its ceiling is covered with paintings by Rubens, representing the apotheosis of James I., events in the life of Charles I., and numerous allegories. Whitehall was the scene of Wolsey's disgrace and the deaths of Henry VIII., Cromwell, and Charles II., while on a scaffold erected in the shadow of its walls, Charles I. met his doom. The Banqueting Hall was transformed into a chapel by George I., and is known now as the Chapel Royal of Whitehall.

Madrid, Escorial.—A celebrated monastery and palace, about 27 miles from Madrid. It was built by the architect Juan de Herrera in fulfillment of a vow made by Philip II. of Spain to St. Lawrence, upon whose day (August 10th, 1557) the victory of St. Quentin was won. It was erected in the fanciful form of a huge gridiron to commemorate the martyrdom of St. Lawrence. The great interior courts form the intervals between the bars, and a group of buildings on the east forms the handle. The mass of the buildings is 786 feet by 623 feet and tall towers on the angles form the legs of the gridiron. The palace includes a church of the Greek cross plan with a dome over the center. Part of the building now houses a distinguished collection of paintings including works by Titian, Van der Weyden, and Velasquez.

Mexico City Cathedral.—Built of a gray stone, ornamented by low reliefs, statues, friezes, bases, and capitals of white marble. There are two towers, each 203½ feet high; Doric is used in the lower divisions, and Ionic in the upper, and the crown of each is a bell-shaped dome capped by spheres and crosses of stone. The walls are very thick, but the inside measurements of the edifice are 387 feet from north to south, 177 feet from east to west, and 179 feet interior height. The cornices on the façade are adorned by bases, statues of the doctors of the church, of the patriarchs of the monastic orders, and of the theological virtues and their attributes. The cornerstone was laid in 1573 by Castaneda near the site of an ancient Aztec temple. Architects of later parts of the building were Juan Gomez de Mora, and Manuel Tolsa. The foundation and part of the walls were completed in 1615, and the roof of the sacristy erected in 1623; the first service was held in 1626, and the first dedication occurred on February 2, 1656. The towers were completed in 1791. The church furniture, such as the organ case and the choir stalls, is very richly carved in wood. The total cost was over $2,000,000, of which $190,000 was for bells. The great bell cost $10,000, and is 19 feet high.

Paris, Hôtel des Invalides.—An establishment in Paris founded by Louis XIV. for the accommodation of the wounded soldiers of the French Army. It was started by Liberale Bruant, but the chapel with its justly famous dome is the work of J. H. Mansart at the end of the seventeenth century. The interior of the dome is lighted by windows concealed in the drum. In its crypt is the tomb of Napoleon, a large monolithic sarcophagus of red granite. The crypt is 20 feet deep and 36 feet in diameter.

Paris, Louvre.—The chief palace of the kings of France in Paris down to the time of Louis XIV. when Versailles was built. The present building was begun in 1546 by Francis I. on the site of an old medieval castle. The oldest portion of the present building is the south half of the west side of the court, embellished with the sculpture of Jean Goujon and built by Pierre Lescot whose plan for the future development of the building was followed. The most famous of the later additions to the building is the east front by Claude Perrault in 1668. This façade, 570 feet long is bounded by a pavilion at each end while the central portion consists of a portico of 28 pairs of Corinthian columns. The long wing beside the Seine, and other parts of the building, house the world-famous art collection of pictures and statuary.

Pavia Certosa.—A former Carthusian monastery, one of the largest and most splendid in the north of Italy. The church was founded in 1396 and contains the tombs of the Visconti, the ruling family of Milan. The interior of the church is chiefly Gothic, but the cloister, which is very large, and the façade were erected about 1492 by the architect Amadeo. The exuberant richness of the decoration, the refinement of the detail, and the use of color, are typical of the Early Renaissance in this part of Italy, as is the lavish use of terra cotta in the cloister. The sculpture on the building is largely in the style of the Mantegazza. The lavishness and lawlessness of such work which was seen by the French during their invasions of the peninsula had great influence on the first French works of the Renaissance.

Rome, Farnese Palace.—One of the finest palaces in Rome built for the Cardinal Alessandro Farnese, later Pope Paul III., by Antonio da San Gallo the younger. The stones were taken from the ruins of the Colosseum and the Theater of Marcellus. The third story and the cornice were added by Michelangelo, while the loggia, which faces the Tiber overlooking the extensive gardens, is the work of Giacomo della Porta. The famous gallery of

Mino da Fiesole, is sometimes over-refined and too subtle. Verrocchio sums up the fifteenth century, trying his hand at many of the subjects which Donatello had attempted and generally improving them slightly. His *Colleoni* in Venice is perhaps the greatest bronze equestrian monument in the world. Other sculptors of the period were Ghiberti, Jacopo della Quercia, A. Pollaiuolo, Ant. Rossellino, Amadeo, Bregno, and Laurana.

In the sixteenth century the classic ideas, as in architecture, became stronger, with the not infrequent result of cold and lifeless production. The greatest genius, however, of the period is not at all of this character. In the very first rank as poet, architect, and painter, Michelangelo accounted himself primarily a sculptor. His mind could conceive only such gigantic projects as the tombs of Julius II. which from the size of the original project was doomed never to be completed. The *Moses* and the *Bound Slaves* are parts of the scheme. The Medici Tombs in the sacristy of San Lorenzo in Florence interpret the soul of an almost medieval Christian and an ardent patriot, struggling with a pagan love of physical beauty, and weighed down by the corruption of the times, the subjugation of Florence, and the invasions of Italy. The colossal, sorrow laden, brooding forms of the *Day and Night, Twilight and Dawn* express his restlessness and his contempt for the times. Other works by him include the *Bound Slaves* of the Louvre, the *Pieta* in St. Peter's at Rome, and the *David* in the Academy in Florence. Among other men of the period may be mentioned Giovanni da Bologna, Jacopo Sansovino, and the goldsmith sculptor Cellini whose autobiography has long been a classic. As in architecture the greatest figure of the Italian baroque was Gian Lorenzo Bernini whose extravagant displays of religious ecstacy, whose pictorial sweeps of drapery, and whose theatricality can never disguise their technical merit or their splendid vitality.

In France the sculpture followed the same movements as the architecture, swinging back and forth from freedom to classicism. At the beginning, the extremely delicate and graceful work of Jean Goujon as in the *Fountain of the Innocents* at Paris suggests comparison with certain products of the height of Greek sculpture. The heavy classic work of Coysevox and the academic correctness of Puget reflect the period of Louis XIV. in sculpture as J. H. Mansart does in architecture. Pigalle, Falconet, Pajou, and Clodion reproduce the license, the sprightly gaiety, the boudoir character of the time of Louis XV. In Houdon, we find a portraitist of the very first rank, in that combination of the individual and general which results in a reproduction not merely of the subject's features, nor even the greater portrayal of the spirit, but of a type transcending the subject and even the time. Among his portraits were heads of Washington, John Paul Jones, and other Revolutionary characters.

Chihuahua Parish Church.—This, the most important building in the city, was erected between the years 1717 and 1789 by revenues derived from a tax on the silver output of the mine of St. Eulalia, amounting, it is believed, to $800,000. The most noticeable characteristics of the building are the sense of lightness and grace. This effect is secured largely by the unusual height in proportion to the width, not only of the main building but of the towers. The façade is richly adorned by statues of San Francisco and the twelve apostles.

Florence, San Lorenzo Church.—Begun in 1425 by Filippo Brunelleschi for the Medici family. The interior of the church, which is one of the earliest Renaissance examples, has an arrangement similar to that in the Early Christian basilicas. The new sacristy started in 1520 is the work of Michelangelo built for the second Medici pope, Clement VII. It contains the celebrated Medici Tombs of Giuliano de Medici and Lorenzo de Medici, with the figures of *Day and Night,* and of *Dawn and Twilight.* Parts of these figures were never completely finished which may enhance rather than detract from their restless power. The façade of the church has never been completed, though designs for it have been submitted by many architects including Michelangelo himself.

Florence, Santa Maria Del Fiore Cathedral.—Begun in 1296 by the Florentine architect Arnolfo di Cambio. The bulk of the church is Gothic in style. The tower beside the church is also Gothic, designed by Giotto, and decorated with sculptures in relief by Giotto and Andrea Pisano. The great dome over the crossing has a span of 138½ feet, almost as great as those of the Pantheon and the church of St. Peter's in Rome, and is by Brunelleschi, who was the first great Italian architect of the Renaissance. The dome is octagonal, built of two shells, the structure being inspired as in so much work of the early Renaissance by the medieval baptistry in front of the Cathedral. The building is 500 feet long and 128 feet across the nave and sides.

Florence, Palazzo Pitti.—A palace in Florence said to have been designed by Brunelleschi, though his connection with the building is doubtful, begun in 1435. The rear portion of the building was done over about 1560 by Ammanati to receive the Ducal family. It is now the repository of a world famous collection of paintings, and is connected by a very long passageway, which crosses the river Arno, with the Uffizi Gallery by Vasari which also houses a splendid collection of paintings. The Pitti Palace is built of quarry faced ashlar, and has a series of columns composed of blocks of stone alternately large and small.

Heidelberg Castle.—The most noteworthy example of the German Renaissance. It was founded in the thirteenth century by the elector palatine, Rudolph I. Two large wings, the Ottoheinrichsbau (1556–63) and the Friederichsbau (1601–07) are the parts coming from the Renaissance. The detail, inspired by the profusion of North Italy, is unrestrained, and lacks the beauty of its model because of its crude and coarse handling. The building has suffered much and was among the most impressive ruins in Germany. It is now being used for a museum and consequently is in better condition.

London, St. Paul's.—This great monument of the English Renaissance was begun by the architect Sir Christopher Wren in 1675 to re-

place the fine Gothic Cathedral which had been destroyed by the great fire of London in 1666. The church is in the form of a Latin Cross 514 feet long and 287 feet wide. The dome which covers the crossing is 102 feet in diameter, and rises 365 feet in the air, becoming a landmark for miles around. On the façade, we find a two-storied classic portico of Corinthian columns crowned by a pediment, and flanked by spires using classic detail. Much of the fine carving on the interior is by Grinling Gibbons. Wren is buried in the building with a single motto on his tombstone, "If you desire a monument, look around you." The cost of the whole building, which is of Portland stone, was nearly $4,000,000, being the proceeds of the tax on coal brought into the port of London during its erection. The great bell of this cathedral is tolled only on the occasion of a death in the royal family.

London, Whitehall Palace.—Originally built by Hubert de Burgh in the reign of Henry III., James I. undertook to rebuild it after its destruction by fire in 1615. Inigo Jones laid out a colossal plan for a new palace in 1619 of which one room only, the Banqueting Hall, was erected. This is 111 feet long, 55½ feet wide, and 55½ feet high. Its ceiling is covered with paintings by Rubens, representing the apotheosis of James I., events in the life of Charles I., and numerous allegories. Whitehall was the scene of Wolsey's disgrace and the deaths of Henry VIII., Cromwell, and Charles II., while on a scaffold erected in the shadow of its walls, Charles I. met his doom. The Banqueting Hall was transformed into a chapel by George I., and is known now as the Chapel Royal of Whitehall.

Madrid, Escorial.—A celebrated monastery and palace, about 27 miles from Madrid. It was built by the architect Juan de Herrera in fulfillment of a vow made by Philip II. of Spain to St. Lawrence, upon whose day (August 10th, 1557) the victory of St. Quentin was won. It was erected in the fanciful form of a huge gridiron to commemorate the martyrdom of St. Lawrence. The great interior courts form the intervals between the bars, and a group of buildings on the east forms the handle. The mass of the buildings is 786 feet by 623 feet and tall towers on the angles form the legs of the gridiron. The palace includes a church of the Greek cross plan with a dome over the center. Part of the building now houses a distinguished collection of paintings including works by Titian, Van der Weyden, and Velasquez.

Mexico City Cathedral.—Built of a gray stone, ornamented by low reliefs, statues, friezes, bases, and capitals of white marble. There are two towers, each 203½ feet high; Doric is used in the lower divisions, and Ionic in the upper, and the crown of each is a bell-shaped dome capped by spheres and crosses of stone. The walls are very thick, but the inside measurements of the edifice are 387 feet from north to south, 177 feet from east to west, and 179 feet interior height. The cornices on the façade are adorned by bases, statues of the doctors of the church, of the patriarchs of the monastic orders, and of the theological virtues and their attributes. The cornerstone was laid in 1573 by Castaneda near the site of an ancient Aztec temple. Architects of later parts of the building were Juan Gomez de Mora, and Manuel Tolsa. The foundation and part of the walls were completed in 1615, and the roof of the sacristy erected in 1623; the first service was held in 1626, and the first dedication occurred on February 2, 1656. The towers were completed in 1791. The church furniture, such as the organ case and the choir stalls, is very richly carved in wood. The total cost was over $2,000,000, of which $190,000 was for bells. The great bell cost $10,000, and is 19 feet high.

Paris, Hôtel des Invalides.—An establishment in Paris founded by Louis XIV. for the accommodation of the wounded soldiers of the French Army. It was started by Liberale Bruant, but the chapel with its justly famous dome is the work of J. H. Mansart at the end of the seventeenth century. The interior of the dome is lighted by windows concealed in the drum. In its crypt is the tomb of Napoleon, a large monolithic sarcophagus of red granite. The crypt is 20 feet deep and 36 feet in diameter.

Paris, Louvre.—The chief palace of the kings of France in Paris down to the time of Louis XIV. when Versailles was built. The present building was begun in 1546 by Francis I. on the site of an old medieval castle. The oldest portion of the present building is the south half of the west side of the court, embellished with the sculpture of Jean Goujon and built by Pierre Lescot whose plan for the future development of the building was followed. The most famous of the later additions to the building is the east front by Claude Perrault in 1668. This façade, 570 feet long is bounded by a pavilion at each end while the central portion consists of a portico of 28 pairs of Corinthian columns. The long wing beside the Seine, and other parts of the building, house the world-famous art collection of pictures and statuary.

Pavia Certosa.—A former Carthusian monastery, one of the largest and most splendid in the north of Italy. The church was founded in 1396 and contains the tombs of the Visconti, the ruling family of Milan. The interior of the church is chiefly Gothic, but the cloister, which is very large, and the façade were erected about 1492 by the architect Amadeo. The exuberant richness of the decoration, the refinement of the detail, and the use of color, are typical of the Early Renaissance in this part of Italy, as is the lavish use of terra cotta in the cloister. The sculpture on the building is largely in the style of the Mantegazza. The lavishness and lawlessness of such work which was seen by the French during their invasions of the peninsula had great influence on the first French works of the Renaissance.

Rome, Farnese Palace.—One of the finest palaces in Rome built for the Cardinal Alessandro Farnese, later Pope Paul III., by Antonio da San Gallo the younger. The stones were taken from the ruins of the Colosseum and the Theater of Marcellus. The third story and the cornice were added by Michelangelo, while the loggia, which faces the Tiber overlooking the extensive gardens, is the work of Giacomo della Porta. The famous gallery of

devouring a hare, did not prevent broad rendering of forms toward the end of his life. The human types, and the joy of life in Carpeaux, may be traced to his Flemish ancestry. In him we find certain baroque elements: The sensuality, complex composition, and an almost pictorial love of accessories in his groups on the Opera House at Paris. He often chose romantic subjects like the *Ugolino Devouring His Sons,* which was inspired by Dante. Fremiet preferred the Romantic in both subject and costume, producing a series of fine works such as the *Jean d'Arc* or the *du Guesclin,* both of which employ the garb appropriate to their subjects. The Flemish influence of Rubens appears even more strongly in Dalou than in Carpeaux with an almost pictorial effect, while Falguière and his pupil Mercié introduces us to the frankly feminine nude. Of the conservatives, Pradier, Chapu, and Dubois are perhaps most worthy of mention. In general the conservative academy took up the innovations of the progressives when they had become well established.

Rodin was perhaps the greatest French sculptor of the century, bringing to a culmination the realistic, pictorial, and impressionistic movements exemplified by the preceding men. He has sometimes been called the Michelangelo of France. At first, Rodin reproduced nature as exactly as possible, at times even taking casts from parts of the living model. The *Bronze Age* was refused by the jury on that ground. Later he began more and more to leave parts of the work in the rough, omitting details and employing masses in order to intensify and dramatize the effect, as in the *Six Burghers of Calais,* which he planned to place on the ground instead of on a pedestal. Such a broad impressionistic handling heightens the effect and gives a feeling of mystery. In his greater works at the end of his life, the *Balzac,* for example, he tried to represent the spirit, the vitality, and the eternal aspect of his subjects by forms more or less personal to himself rather than by external appearance. His extreme movement might be condemned as too pictorial were it not that the action is arranged so as to produce tension within a compact group, as in the *Gates of Hell.* His impressionism produced by a series of bosses and hollows which create a stirring play of light and shade over the surface of the stone or bronze aided him to become perhaps the greatest master of color in sculpture in modern times. Bartolomé, who also stressed the pictorial qualities of sculpture, surpassed himself in the depth of conception, skill of composition and execution, in the *Monument to the Dead* in the Père Lachaise Cemetery in Paris.

Although France indisputably led the way in artistic matters in the nineteenth century, and the other countries of Europe merely reproduced what she had started, some men outside of France must at least be mentioned. The extremely personal style of the German Klinger shows pictorial and decorative qualities, original arrangement, and polychromatic effects. In Belgium, the realistic ideal is best exemplified in Meunier's treatment of themes taken from the laboring classes which are handled in much the same way that Millet treats his peasants, showing a heroic beauty in these types. The Spaniard Miguel Blay treats much the same sort of themes with less success. Victor Rousseau in Belgium is essentially academic, giving us technically excellent studies of feminine nudes, which are valuable as studies rather than embodiments of ideas. Rodin's realistic phase has found a follower in Spain in his pupil José Clará. In Italy, an extreme of realism sometimes called "verism" is reached in Vela and more especially in Gemito. Bistolfi, on the other hand, introduces a greater degree of symbolism which is happily combined with technical excellence, and a taste for delicate line. Impressionism has found advocates in the Norwegian Vigeland, and in Troubetzkoi, the Russian.

Certainly the greatest English sculptor of the last century and perhaps of all time was Alfred Stevens. Though self-trained, he was a good sculptor, whose work showed more of the spirit of the Renaissance than that of the antique. His composition is compact; in a feeling for bigness of form a comparison with Michelangelo is not amiss; nor can he be accused of lacking either originality or a keen sense of beauty. The growing realism of the time in France leaves its trace on Brock, Leighton, Wood, and Thornycroft. The impressionism of Rodin finds its echo in the sculpture of Watts, the painter, whose *Physical Energy* is a noble embodiment of that quality. Drury and Ford must also be mentioned. In the Arts and Crafts Movement, Frampton and Gilbert are perhaps the most prominent names, the former being best known for his design and his use of polychromy, and the latter for his bronzes.

The movement commonly called "stylization" attempts to increase the artistic qualities of a work by a distortion of the forms sometimes in the direction of archaic or eastern linear emphasis, sometimes by emaciated figures and again by making bodies heavier for greater sculptural solidity. Though not a member of the group himself, the German, Adolf Hildebrand, may almost be regarded as a forerunner. His simplified, Polyclitan forms are closely akin to the modern ideal of form for form's sake. Maillol in France returns to the glyptic forms of archaic art in the *Seated Woman,* putting his emphasis on the massive and compact, rather than on line. He abandons the impressionism of Rodin in favor of extremely simple modeling of powerful feminine types. Bourdelle has become even more primitive than Maillol, and Landowski may be placed in the same group. The emaciated forms of Minne, the Belgian, are again employed by the German Lehmbruck to express the *Weltschmerz,* or World's Sorrow, but in both we find the figures crushed by their burden instead of being capable of supporting it, as could the miners of Meunier, or the peasants of Millet the painter. The simplification of figures into sharply defined planes distinguishes the work of Frans Metzner, the Austrian, whose figures on the *Battle Monument* at Leipzig have as much architectural character as can be found in any modern work. With the possible exception of Maillol, the greatest figure is that of the Jugoslav, Ivan Mestrovic. Intensely patriotic, he has glorified the history of his country in a series of works which seem to emphasize the elemental power of the race, and

its semi-barbaric background. He successfully combines the sculptural feeling and the decorative quality of the primitives, a fine feeling for beauty of material and the architectonic quality of his master, Metzner. Many of his best works are in wood. It is difficult to select any works for individual mention, but the relief of the *Maiden of Kossovo*, representing an incident of that famous struggle, and the projected temple to commemorate the same battle are among the best known.

Contemporary with some of the men cited above, and still more recently, other sculptors have followed the current ideas in painting. Abstractions to the *n*th degree find their chief exponent in Brancusi whose works have in them the essence of apparent simplicity. The greatest beauty of his work is not revealed to the eye, but to the touch. Cubism and futurism may be said also to emphasize the abstract form. The former has enlisted the support of the Russian, Alexander Archipenko, whose compact groups like *Family Life* are resolved into the geometric shapes of which they are compounded. In Umberto Boccioni, the Italian futurist, all sorts of materials are employed to enrich the effect by suggesting new lines of thought. If while on a walk or viewing a street, for example, the sculptor sees a church spire, a lady on a wrought-iron balcony, and the prow of a ship, forms suggesting these diverse elements would be incorporated in the work. Among the many sculptors who have tried their hands at one or more of these modes, Lipschitz, Milles, and Barlach stand out, the latter for the same elemental force that Mestrovic shows, but with less decorative effect, and less architectural feeling.

Leningrad, Cathedral of St. Isaac.—Finished about 1850. It is built in the form of a Greek cross, surmounted by a dome 336 feet high, upon which is a lantern. Each of its four grand entrances has a Corinthian portico supported by monolithic columns of polished granite, 60 feet high, surmounted by bronze capitals. The dome, supported by 30 granite columns, is of gilded copper. The interior is rich in fine marbles and columns of lapis lazuli and malachite.

Leningrad, Winter Palace.—The former imperial palace at Leningrad is one of the largest in the world: 455 feet long, 350 feet wide, and providing accommodations for the complete household of over 6,000 persons. It is of the Renaissance style with three stories. Magnificent tables, vases, and doors of malachite; the richest statuary, pictures, and gems; and a magnificent series of Russian historical paintings and portraits are among its wonders. It is connected with the Hermitage, the famous art gallery which contains many of the world's masterpieces. It was burned in 1837 and rebuilt in 1839.

Liverpool, Cathedral.—When completed, this church will be one of the largest of the English cathedrals. The competition for the design was won by Gilbert Scott at the age of twenty-one. The building must be classed as Gothic, though the architect has employed the spirit rather than the forms of that style. It is built of reddish sandstone. Fine scale and proportion give vitality to the huge mass which is but half completed (1929). The important entrances to the building will be in the centers of the long sides, with a tower between them. The choir on the east of this tower will balance the nave on the west. The rich and satisfying Lady Chapel at the southeast corner has been completed.

London, Albert Memorial.—A monument on the south side of Kensington Gardens, erected (1862–3) to the memory of Albert, Prince Consort of Queen Victoria. A colossal bronze-gilt statue of Prince Albert, seated, is supported under a Gothic canopy upon a basement raised on a spacious platform ascended by granite steps. There are 169 marble reliefs adorning the basement; projecting pedestals support the angles and are adorned by marble groups representing *Agriculture, Manufacturing, Commerce,* and *Engineering;* and at the lower angles are groups representing *Europe, Asia, Africa,* and *America.* Sir George Gilbert Scott was the architect.

London, British Museum.—While the interest in this building centers in the magnificent collections which it contains, it must not be forgotten that in its present aspect it is one of the best examples to be found in England of the Classic Revival and a protest against the Baroque. Designed by Sir Robert Smirke, it reached its present stage in 1847, and is the result of many additions made to the original Montague House, which was acquired early in 1700. It is now a hollow square of Ionic architectural design, with an imposing façade of 370 feet fronting on Great Russell Street and flanked by the residences of the highest officials. The reading room is circular and surmounted by a dome 106 feet high and 140 feet in diameter. Several acres of land have been recently acquired to provide for the unceasing extension necessary to keep pace with the frequent additions and steady growth of the collections.

London, Houses of Parliament.—The rebuilding of this edifice, which began in 1836 according to plans by Sir Charles Barry, was a result of the efforts of Scott and Ruskin to influence the popular mind in the revival of the Gothic. The buildings cover eight acres and contain upward of 500 apartments clustered around 11 open quadrangles or courts. They are of gray limestone, of a rich, but not ornate Gothic style, with square towers of support at certain points. This is one of the noblest structures of the last century, and a most successful attempt to apply the truly northern style of architecture to secular buildings. The architect, who was a classical student, was compelled to work out his design in the Gothic style, which he did most loyally, helped by W. Pugin, to whom he intrusted the whole of the decorative features. Neither would have produced such a perfect work single-handed.

London, Westminster Cathedral.—An enormous edifice begun in 1894 by the architect, J. F. Bentley. Although in area the building ranks only tenth among the English cathedrals, in cubic contents it is second only to St. Paul's in London. The nave is 60 feet wide with a vault which rises 112 feet from the pavement. The tower is 280 feet high. In style, a modernized version of Byzantine has been employed with low, saucer-shaped domes covering the nave. These are most impressive from the interior but

fail to create any marked accents on the exterior. The structure of the building is concrete, faced with brick which is arranged in many patterns. Green slate has been used for the roofs. Colored marbles and mosaics will cover the brick surfaces of the interior; no doubt the resulting polychromatic effect will be splendid, but it is probable that the impression of power now imparted to the visitor will be lessened. It is important to distinguish between this, the Roman Catholic Cathedral of London, and Westminster Abbey which belongs to the Church of England.

Paris, Arc de Triomphe de l'Etoile.—The largest existing triumphal arch, at the head of the Champs Élysées in Paris was designed by Chalgrin, and erected by Napoleon in commemoration of his victories, but not completed until 1836. It is 146 feet wide, 160 feet high, and 72 feet deep. One of the many noteworthy sculptures upon it, is the vigorous group *The Marseillaise*, by Rude, which has in it a touch of the sublime. The name means "the triumphal arch of the star." It is so named because it is located at the point whence 12 avenues radiate in the form of a star.

Paris, Church of the Madeleine.—Begun in Paris under Louis XV., but received its present form from the architect Vignon between 1807–42. Work upon it was delayed by the Revolution, but was resumed with increased vigor under the Empire. It is a huge Roman-Corinthian temple, 141 by 354 feet and 100 feet high. The building is without windows and is lighted wholly from above. Reinach says: "Parisians and visitors to Paris, having seen the Madeleine, have some general idea of the form of a Greek temple."

Paris, Column of Vendôme.—A Roman-Doric column of stone, covered with bronze plates in relief, to commemorate Napoleon's victories over the Austrians and Russians in 1805. It is in the Place Vendôme, Paris. During the Commune (1871) Courbet, in an effort to distract the raging mob from the Louvre, directed them against this column. Courbet restored it at his own expense in 1875.

Paris, Opera House.—A splendid building built from 1861–1874 by the architect Charles Garnier. In area, it is one of the largest theaters in the world, covering 13,596 square yards. The magnificent site facing the Avenue de l'Opéra, cost almost $3,000,000 and the building cost $7,300,000. The seating capacity is over 2,000. The exterior is essentially classic, but is modified and enriched according to the ideals of the École des Beaux Arts at that time. The Grand Staircase on the interior of the building is of sumptuous design, incorporating various colored marbles. The exterior is adorned with sculpture, and the interior with sculpture and paintings.

Paris, Bibliothèque Sainte Geneviève.—This building, the architectural predecessor of the Boston Public Library, was inspired probably by the Church of San Francisco at Rimini in Italy. It was built by Labrouste from 1843–50. The effect is severe in the extreme, arch after arch succeeding each other as in the Roman aqueducts.

AMERICAN ARCHITECTURE

When this country was first settled in the seventeenth century, it was but natural that the architecture of the individual colonies should reflect that of their respective countries. Such was actually the case, but modifications were introduced to adapt the native styles to different climatic conditions. In New England, the houses were a development of the English yeoman's cottage translated into forms of wooden construction, since that material was available. A rectangular plan centering around a huge chimney was the rule, and the kitchen was the center of the family life. One of the oldest is the Fairbanks House at Dedham, built before 1650, which is only one from a host of excellent examples. To the south, a more open type of building appeared, to defend the occupants rather from excessive heat than cold. Nor were churches neglected. Among the earliest and most interesting is St. Lukes, Smithfield, Virginia, which belongs to the late Gothic tradition rather than to the Gothic revival of the nineteenth century. In the Old Ship Church, Hingham, Massachusetts, the Puritanical meeting house form was used, in contrast to the Episcopal type of the Virginia example. Work at this time was as direct and simple a solution of a given problem, as could well be devised. It was so of necessity, for the gracious side of art cannot appear until some material security or comfort is assured.

The same racial characteristics continue in the eighteenth century, which however, reflects accurately the more developed life. Since men could now do more than simply provide for their own needs, they naturally adopted the current style of the mother country. So in Virginia and New England, one finds a provincial version of the English Georgian which rather gains than loses by its native flavor. The chimneys were moved to the ends of the house; larger windows suggested the more ample living conditions; and the whole was finished with columns, pilasters, and Palladian details. The latter were frequently taken bodily from architectural copy books imported from England, but such was the skill of the woodworker that one finds his products free hand in effect and superbly executed. The John Vassall House, Cambridge, Massachusetts or the Royall House, Medford, Massachusetts, and still more the wings devoted by the Metropolitan Museum in New York, and the Museum of Fine Arts, Boston, to American decorative arts provide splendid opportunities to study this style.

Nevertheless, it must not be imagined for a moment that all the glorious colonial of this country was English in inspiration, in spite of the common identification of the terms with the more prominent English style. In New York the Dutch left a mark which has fortunately had its influence on the work of the present day. The verandah, the curving roof line, the wide clapboards, and a general expansive spirit pervade the Dyckman House in New York, and many others up the valley of the Hudson River. Or in Philadelphia, one finds the Pennsylvania Dutch leaving their trace in a sober, highly dignified series of works in brick or stone—

Cliveden in Germantown to cite but a single instance. Again in the district around New Orleans very high narrow windows and delicate wrought iron balconies or grills betray the French origin of the district. Last, but by no means the least important, must be mentioned the colonial work of the south west which in spite of the late date of some of the buildings has as just a claim to the term as any New England mansion or church. Here the source was Spanish, but simplified to a considerable degree by a lack of resources and possibly by contact with the adobe work of the Indians. The blazing sunlight suggested small windows and the almost bare effect was produced by large unbroken wall surfaces, sometimes slashed by the black shadows of beams protruding from the wall, and sometimes being constructed with spots of decoration whose richness only a Spaniard could conceive. Dozens of mission churches, such as the Alamo in Texas, bear witness to the present day to the power of the monks. This style has inspired many fine modern works such as Goodhue's buildings in the Panama California Exposition of 1914 in San Diego.

As the eighteenth century drew to a close, this country had the distinction of leading the world in an architectural movement. The State Capitol at Richmond, Virginia, by Thomas Jefferson, may be regarded as the foundation of the Early Republican style in this country which corresponds to and precedes Neo-classicism in Europe. Fortunately for us, the vast majority of buildings of this time do not show the cold and lifeless character which mars so much of the European work. Jefferson was a noteworthy student of antiquity, and of architecture also. His own home at Monticello and the University of Virginia at Charlottesville attest the fact. The Boston State House, the church at Lancaster, Massachusetts, and a host of houses illustrate the classic quality in the work of Bulfinch, while the City of Washington was started on its way to its present beauty through the excellent plan of l'Enfant.

The Romantic revival started in this country with the work of Richard Upjohn whose Trinity Church, New York, uses English Gothic for its inspiration. A more pretentious attempt was St. Patrick's Cathedral, New York, in which James Renwick turned to French Gothic instead of English for his inspiration. Later on we find H. H. Richardson attempting to revive the Romanesque. He believed that its straightforward sturdiness was adapted to American needs, and that it could be made into a national style. In his own work like the Allegheny County Court House or Trinity Church, Boston, he was most successful, but no one had the genius to continue his work. R. M. Hunt must be classed with these other men as an eclectic. In his designs for skyscrapers, he was no more successful than the other men of his time, but some of his classic designs may be termed great.

The series of expositions in the last quarter of the nineteenth century served as a barometer of attainment, but their importance as an educating factor in American taste cannot be overemphasized. The Philadelphia Exposition of 1876 was pretty poor on the whole. The best one can say is that some of the buildings were impressive by their size. But it was the World's Fair in Chicago, 1893, housed in the White City, which was most significant. The great architects and sculptors of the country gathered and, in collaboration, produced an ensemble which was fine, judged by any standards, but to the untraveled American was supremely beautiful. The buildings were almost uniformly classic in design, and were distinguished by purity of detail and fine proportions. They bid fair to establish a modernized classic as the standard style for the country.

Since that date, American Architecture has improved rapidly and steadily until, at the present day, though not as modernistic as some European work, it shows a purity and a sense of proportion that need bow to none. Even to mention the leaders of the profession is difficult. In domestic work, architects have been most fortunately inspired by the several branches of our own colonial, generally modifying the older work to suit present day demands. Such men as Dwight Baum, W. T. Aldrich, Aymar Embury, C. A. Platt, and Mellor, Meigs, and Howe, are among the most popular, though it is difficult and almost unfair to choose from such a large field. Colleges and educational buildings have tended to be colonial where they follow the type of the earliest buildings of the college, or Gothic where they are modelled after the great English universities of Oxford and Cambridge. The former may be illustrated by the recent Harvard buildings of Coolidge, Shepley, Bulfinch, and Abbott, and the latter in the Harkness dormitories at Yale by J. G. Rogers or in the recent work of Day and Klauder at Princeton and elsewhere. In churches, one finds works inspired by all periods and nations, though the colonial and the Gothic are again the favorites, but the Roman Catholics have put up a number of splendid Romanesque and Byzantine examples in recent years. The most gifted genius here was the late B. G. Goodhue, who tried his hand at many different problems and as many different styles, and never failed to produce works that are original, interesting, and in good taste. Cram and Ferguson, Maginnis and Walsh, H. B. Upjohn, H. Vaughan, and Allen and Collens are perhaps the leading names in this field. For public buildings, especially of the larger sort, classic has been almost universal, though the Nebraska State Capitol by Goodhue is more strikingly original. McKim, Mead, and White have probably done more first class buildings of this type than anyone else, but Guy Lowell, Cass Gilbert, Carrere and Hastings, Bakewell and Brown, and J. R. Pope must also be mentioned.

The most original work that America has yet produced in architecture has been in the field of commercial architecture. Although some types of buildings have held strictly to known styles, banks, and railroad stations for example, —others like the skyscrapers have been new problems which enforced original solutions. The need for a building of this sort is primarily the desire of business men to be at the center of a city, and as close together as possible. It was made possible by the new materials, structural steel and reinforced concrete, and also by the high speed elevator. Among the early examples of the skyscraper, some of the worst results in

the whole field of architecture are to be found. Even when good architects attempted the problem, the classic types failed to provide a satisfactory result, since they naturally emphasized the horizontal line in opposition to the vertical demands of the new problem. In the Woolworth Tower, Cass Gilbert uses Gothic to produce one of the best designs executed at that time. The main vertical lines were strongly emphasized, but the detail was of too small a scale for the size of the building. Furthermore, the city streets had become mere canyons with but little sunlight owing to the high buildings on either side. To remedy this situation the New York Zoning Law was passed in 1916. This provided that above a certain height, the upper parts of the building must recede in a series of steps or set-backs, with the exception of a central tower. The results have been extremely encouraging for it was soon realized that, far from being a limitation in design, the law suggested a fine solution in itself. Practically no city of the first magnitude in the country lacks some example of this inspiring type. The general scheme is to use a few lower stories as a base member with big monumental elements. Above this, the mass of the building rises, often with extreme simplicity. The upper stories are set back for a greater or less degree and are generally decorated in a modern style. The effect depends rather on the masses, the relation of the upper parts, and the silhouette of the whole. To select individual examples is difficult where there are so many to choose from, but one may mention the Chicago Tribune Tower by Howells and Hood, Eliel Saarinen's design of the same building (placed second); the American Radiator Building in New York by Hood; the Southwestern Bell Telephone Company Building in East St. Louis by Mauran, Russell and Crowell; the Pacific Telephone and Telegraph Building in San Francisco by Miller and Pflueger; McKenzie, Voorhees, and Gmelin's masterpiece, the Barclay-Vesey Building in New York; and the Shelton Hotel by A. L. Harmon, which has been awarded a gold medal.

Taking a comprehensive view of American architecture as a whole, one finds much of which to be very proud. Except for a short period in the nineteenth century, one may claim that America has always demanded refinement from its architects, and that they have been able to meet the demand. Then, proportions rather than lavish ornament, simplicity rather than the ornate have been dominating characteristics, while in the skyscraper, one has a type which has been developed by us from an eyesore, or a packing box on end as they were scornfully termed at first, to a monument of unquestioned beauty, the admiration of the world.

SCULPTURE IN AMERICA

The beginning of sculpture in this country came at a time when English architecture was in a flourishing period, and English painting was probably at its height. But unfortunately, the English development has not been at all in the direction of sculpture. The result was that the primarily British origins of the country left sculpture more or less without foundation. It must be admitted that this branch of the fine arts developed after its sister arts. At first we find, in the colonial period, occasional foreign artists. Some of them like Houdon were among the very best, but our first real sculpture belongs to the neo-classic period, and betrays the faults of that revival, aggravated by inferior technical accomplishments and only too often by a lack of taste. Greenough, Powers, and Crawford were perhaps the best of the group, but with a few exceptions, their productions are weak and dull.

Better days were at hand. With H. K. Brown, and T. Ball, more dignified results are obtained. One finds in general a simplicity and sincerity, admirable qualities we like to think of as American, coupled often with a dash of sentiment. Both of these men have done first rate equestrian portraits of Washington in which there is a just relation between rider and horse, technical skill adequate to the task, and a fine impression of power and dominance in the portrait itself. J. Q. A. Ward, with his sturdy manliness, is a worthy successor to this line. Although one fails to find many of the qualities which would be required at present, such as sculptural color and beauty of surface, one is impressed because of its simplicity and quietness. Other sculptors of the time were E. D. Palmer, W. W. Story, W. H. Rhinehart, R. Rogers, J. Rogers, W. Rimmer, and Harriet Hosmer, the first notable sculptress.

About the time that architecture was being stimulated by the World's Fair, a change came over sculpture. Paris, rather than Italy, became the training ground, and a desire for truth no less accurate than the best previous work, but more expressive and picturesque was manifested. More attention was paid to beauty of surface, the technique was more facile, and in every way, the primness of the nineteenth century gives way to greater sophistication. The work of Augustus Saint Gaudens illustrates these characteristics. He was a sculptor worthy to take his place among the great. Study in Paris was aided by a phenomenal skill with his hands and technique became, as it should be, a thing of beauty in itself, but withal only a means to an end. The real reason for St. Gaudens' high place is his sculptural imagination, expressed in the dignified structure, and the fine composition of his works. He seems to have thought and visualized in terms of bronze. The *Lincoln* of Lincoln Park, Chicago, set a new standard in portraiture. It proved that with sufficient genius even the refractory modern costume may be made distinguished. It is hardly necessary to point out the beauty of surface with its play of light and shade; the necessity of the chair to provide additional quiet mass and background; the easy pose, or above all, the magnificent characterization combining benevolence and charity with the firmness of high idealism. Another work is the *Deacon Chapin* in Springfield, Massachusetts, which transcends the individual and becomes an embodiment of our ideas of Puritan manhood. The *Adams Memorial* in the Rock Creek Cemetery in Washington creates an atmosphere of awe, and almost of reverence in every spectator. To cite but one more example, we find him equally a master of composition in relief in the *Shaw Memorial* in Boston. Its marching negro troops have the effect of an accompani-

ment in a minor key by suggesting resistless movement or perhaps fate; a fitting treatment for the noble subject of the relief. He had the ability to harmonize his work perfectly with the surrounding architecture.

But if St. Gaudens were the greatest American sculptor of his time, he was by no means the only one. D. C. French had quite a different spirit. Where St. Gaudens was vivacious, French was serene and genial in spirit. With less striking technique, he yet succeeded in the *Minute Man at Concord* in producing a dignified youth not unworthy of guarding the historic bridge, while in the Milmore Memorial representing *Death Stopping the Hand of the Sculptor*, at Forest Hills Cemetery in Boston, we find a deservedly popular work of excellent technical and imaginative qualities. He sometimes leans toward the pictorial side of sculpture where St. Gaudens had more architectonic feeling. In MacMonnies one finds extreme dexterity coupled with audacious invention. *The Bacchante*, full of realism and sunburnt mirth, produced a storm of criticism when it was completed, probably because of those very qualities. The *Nathan Hale*, New York, was an artistically fine interpretation of the personification of patriotism. Of still a further type is G. G. Barnard. One looks in vain for the charming or the pretty in his works, but to replace these, the nobler realms of thought and of composition, unconventional, but extremely sculpturesque are evident. Like Rodin, he sometimes leaves parts of the work in the unhewn stone. The *Two Natures* leaves the outcome uncertain, even leaves undetermined which is the good, and which the bad. Or in the groups flanking the entrance of the State Capitol at Harrisburg, Pennsylvania, the same essentially sculpturesque, extremely compact composition is apparent. Realism, sculptural color, and invention are displayed in P. W. Bartlett, whose equestrian *Lafayette* in Paris is a happy combination of fact and symbol, while the feminine busts of H. Adams will be perpetually charming. C. E. Dallin is best known for his restrained Indian subjects in which field he is a leader. Unlike many works of this type, he shuns the sentimental and melodramatic which are only too easy to achieve. K. Bitter has been most prolific in the realm of decorative sculpture and many fine bronzes attest his ability. Lorado Taft has earned the title of the American Vasari, but his *Blackhawk* shows a bigness of conception which gives him a place in his own right in American sculpture. The sinuous grace, subtlety, and refinement of I. Konti; the fine modelling, the imaginative characterization of his portraits and the thoughtful symbolism of Grafly; the pictorial qualities of H. A. MacNeil in his Indian subjects are also noteworthy. G. Borglum at his best approaches the impetuous power of Rodin as in the *Apostles* of the Cathedral of St. John the Divine in New York. His ability to conceive gigantic undertakings may be seen at Stone Mountain, Georgia and at Black Hills, South Dakota.

In the younger generation the figure of Manship contrasts strikingly to that of Borglum. Where the latter's work has bigness, Manship tends to essentially smaller interpretations. Where Borglum has some of the ruggedness of Rodin, Manship is delicate and refined, subtle in modelling. Although he accepts suggestions freely from Indian, Chinese, and archaic Greek sculpture, he succeeds in infusing into his works vitality enough to make them living originals. His amazing technique and his fine sense for decorative design may be exemplified by almost any of his works—the *Dancer and Gazelles*, or the *Diana*, to cite but two instances. J. Epstein attempts to embody in abstract forms the spiritual qualities possessed by the subject. The representation of *Sleep* and *Dawn* is a further development of the same line of thought. J. Davidson works along the same lines with less keen penetration. A. S. Calder is best known for his fine group of Washington on the Washington Arch, New York, and his supervision of the sculpture in the San Francisco Exposition of 1914. The vigorous figures of R. I. Aitken, who has also experimented with stylization, the exquisite grace of E. McCartan's feminine figures which embody the contemporary ideal of the American girl; the splendid architectonic decorations of the chapel in St. George's school, Newport, R. I., by J. Coletti; and among the women sculptors, the charming grace and sprightliness of the bronzes of H. Frishmuth; the strong and impressionistic work of M. Hoffman; the delicate characterization of *Jean d'Arc* by A. Hyatt; the delightful children represented in her garden fountain of J. Scudder; and the simple and powerful conceptions of G. V. Whitney embodied in the monument to Columbus are also noteworthy.

Albuquerque, N. M. Hotel Franciscan.—Adopting the native pueblo style of the region as a basis, the architects, Trost and Trost, have here produced a pile that is modern in spirit. Mass and simplicity of details are emphasized, the latter showing in a much modified form its origin in the adobe pueblos of the southwestern Indians. Moreover, the thick walls are well suited to the hot climate. For the same reason, all the 143 suites have outside exposure to procure ventilation as well, of course, as natural light.

Boston, Mass. The Old State House.—An interesting monument of colonial times, this venerable structure built in 1713, still bears the lion and the unicorn of the British Coat of Arms. The simplicity of the whole is typical of the period of colonial architecture as are also the materials—red brick with white trim. It is now a museum.

Boston, Mass. State House.—The capitol of the State of Massachusetts stands at the top of Beacon Hill looking over the Boston Common. Designed by Bulfinch in 1795, the work has received many additions since, but the central portion of red brick surmounted by a gilded dome remains to testify to the taste and fine sense of proportion possessed by the architect. The refined woodwork of the interior may be seen to advantage in the executive offices. The original portion of the structure measured 172'x65' and the dome rises to a height of 155'. The cost of the building was about $160,000.

Boston, Mass. Old North Church.—The church was supported by one of the most historic congregations of the city of Boston, rather than

by the Royalist government. It was known as a hotbed of radical ideas, notably fostering the spirit leading to the American Revolution. The present church, built in 1723 by William Price, was inspired by the work of Sir Christopher Wren. Contrary to the prevailing opinion, it was from the windows of a still earlier church of 1673 in which the congregation of the North Church was worshiping, that the famous signal was sent to Paul Revere—"one if by land and two if by sea." That older building was destroyed by the British for firewood during the siege of Boston in the winter of 1775–6, being chosen for that purpose because of its rebellious reputation. The tower of the present church may have been restored by Bulfinch.

Boston, Mass. Trinity Church.—In using the lantern of the Spanish Romanesque Cathedral of Salamanca and the Romanesque style of Provence in the south of France as the basis of his inspiration, H. H. Richardson in 1877 succeeded in creating one of the masterpieces of American architecture. Although the work smacks of archaeology, its fine composition, its monumentality, its texture, and its massive strength made it widely known abroad, and in the United States, and bid fair to establish Romanesque as the American National Style. The quarry faced blocks give to the exterior a strong rugged appearance which, it was felt, was becoming to the American spirit. It is 211' high. The interior is perhaps less successful than the exterior, but is somewhat redeemed by La Farge's frescoes.

Boston, Mass. Museum of Fine Arts.—It faces Huntington Avenue with its back on the Fenway. Guy Lowell has well utilized this splendid site. Using Maine granite, he created a front of over 500', divided by a court 232'x110' in the center, and with three pavilions using the Ionic order. The fine Ionic portico of the rear elevation is very imposing. The plan has not been carried out in its entirety as yet, though the large wing dealing with the decorative arts was opened in 1929, and contains fine examples of American colonial furniture and architectural details, including many whole rooms. These interiors have been sympathetically treated throughout. Of the other collections, the department of Oriental Art and that of Ancient Art are among the best in the country. In the Rotunda on the second floor, and over the staircase leading to it are mural decorations by Sargent.

Boston, Mass. Public Library.—Facing Trinity Church across Copley Square, McKim, Mead, and White have designed another masterpiece. Completed in 1895, the exterior was inspired by the Bibliothèque St. Geneviève in Paris, but the proportions of that work have been improved. Dignity and refinement are the keynotes of the work. The façade is 225' long. The exterior is of Milford Granite of a delicate pink tint, while the roof is of brown Spanish tiles. The walls of the vestibule are of Tennessee Marble, while in the stair well, Siena and Echaillon marble have been employed. Around the stairway are the murals of Puvis de Chavannes which fit in perfectly with the architecture. On the third floor, Sargent paintings create an equally satisfactory effect. Abbey's series, representing the story of the Holy Grail, in the Catalogue Room attract a great deal of attention for their pictorial and narrative qualities. The building cost about two and one-half million dollars.

Cambridge, Mass. Vassall-Craigie House.—A fine example of 18th century colonial architecture is the house built by Colonel John Vassall in 1759 on Brattle Street, called "Tory Row" by the patriots of 1775, since so many of the wealthy merchants living there were Royalist sympathizers. The house uses four Ionic pilasters along the front with the usual balcony on the roof, and colonial detail inspired by the English Georgian style, which was in turn inspired by Palladio. After the Revolution, the house passed into the hands of Andrew Craigie who made some additions to it. Longfellow occupied the house at one time, but there is little basis for calling the building by his name, though the Park it faces has been dedicated to him with a monument by French.

Charlottesville, Va. Monticello.—Begun in 1796, this home of Thomas Jefferson was designed and frequently remodeled by him. He seems to have delighted in architecture for its own sake, and his private means enabled him to build on a small scale. The plan is carefully studied. It is laid out on two crossed axes, each terminated by a porch. The exterior uses the Roman Doric order with an exactness which places it in the neo-classic period, though the work fortunately lacks the dry correctness of most works of that time, and is distinguished by its fine proportions.

Charlottesville, Va. University of Virginia.—This group of buildings was designed by Thomas Jefferson in 1817 though the project had been discussed for some years. He wrote to Thornton and Latrobe and took suggestions from both of them. The central building was inspired directly by the Pantheon, while the rest of the work may have been suggested by the layout of Marly. The relative importance of the professors' houses and the student quarters provides the rhythm of the design. Throughout we find evidence of Jefferson's keen interest in architectural problems of all sorts. The buildings were judiciously restored in 1896 by McKim, Mead, and White.

Chicago, Ill. Art Institute.—Located on Michigan Avenue this building by Charles A. Coolidge has a splendid location. Like most museums, the style of architecture is modernized classic, retaining the use of the orders and other elements of Greek and Roman architecture, but not with the cold rigidity of the neo-classic period. It was built in 1892–93, and in addition to its valuable collections of painting and sculpture, it includes a number of large casts from medieval architectural and sculptural fragments. It supports a theater and one of the largest and most comprehensive art schools in the country, numbering over 2,000 students annually.

Chicago, Ill. Field Museum.—On a magnificent location at the east end of the park along the lake front, Graham, Anderson, Probst, and White in 1924 erected one of the largest Natural History Museums of the country. The building measures 706' across the front, 337' in

depth, and the general mass of the building is 80′ high. Using the classic vocabulary, the building shows fine proportions and detail and has a most impressive hall in the center. Its only defect is the tremendous size which at the first glance discourages a visitor.

Chicago, Ill. Lincoln Memorial.—Augustus St. Gaudens created one of his greatest bronze masterpieces in this work of 1887. The difficult problem of dress has been exceptionally well handled, and the chair behind the figure gives an artistic support to the whole composition without itself being obtrusive. It faces the main entrance of Lincoln Park, and was the gift of Eli Bates, costing $50,000. The work is considered to embody the spirit and appearance of Lincoln more perfectly than any other of his many portraits. The head of this statue was used on the two-cent stamps issued (1909) to commemorate his birth.

Chicago, Ill., Pennsylvania Freight Terminal.—Although a purely utilitarian building, McLanahan and Bencker have succeeded in giving to this work a massive strength and power which raise it above the commonplace. Brick masses are stripped bare of ornament, and depend on their proportion and silhouette for their cumulative effect.

Chicago, Ill., Tribune Tower.—The competition for this building held in 1923, drew forth one of the most brilliant groups of architects and designs this country had ever seen. The Chicago *Tribune* aroused a great deal of public interest in the work by illustrating famous buildings of the past in its daily sheets. The winning design by Howells and Hood adapts the Flamboyant Gothic of the Tour de Beurre which is beside the Cathedral of Rouen in France, and produced a work so lovely that it wins praise for its own sake. More modern in spirit were the drawings by Eliel Saarinen which were awarded second prize for a logical and extremely beautiful expression of the steel construction of the building. Its vertical mass is emphasized by long architectural lines, exemplifying the setback principle which afforded an interesting silhouette. Third prize was given to Holabird and Roche. Of the many honorable mentions, only that of B. G. Goodhue can be cited here. His design was distinguished by its sturdy strength and its simple masses with plain wall surfaces.

Chicago, Ill. Union Station.—Two large blocks on the Chicago River bounded by Jackson Boulevard, Adams, and Clinton Streets were chosen as the site of this terminal. Graham, Anderson, Probst, and White were inspired by the vast halls of the Roman Baths, but the result is certainly monumental and well adapted to its purpose. The station serves the Chicago, Milwaukee, and St. Paul; the Pennsylvania, the Chicago, Burlington, and Quincy; and the Chicago and Alton Railroads. It is of the double "stub end" type, in which trains leave in opposite directions from two sides of the hall. No attempt has been made to disguise the steel supports of the roof. The waiting room is built of Roman travertine with a vault 112′ high. The sculpture here is by Henry Hering, and Jules Guerin was consulted on the color scheme. Over the main waiting room is the Head House building which measures 320′ x 373′.

Chicago, Ill. World's Columbian Exposition.—The World's Fair, held in 1893 to commemorate the four hundredth anniversary of the discovery of America, created a revolution in achitecture in this country. But few of the thousands who saw the "White City" had been abroad, and to them the pure classic architecture of the Court of Honor, with its uniform cornice line 60′ from the ground, its harmony, and its taste, was a revelation of beauty which bid fair to establish classic architecture as the American style. Burnham and Root, the latter of whom died in 1891 and was replaced by Atwood, supervised the architectural scheme. The landscape design was controlled by Olmsted. A number of architects were consulted and given charge of the individual buildings. Sculpture was under the direction of Augustus St. Gaudens. The whole site in Jackson Park included 686 acres, but the actual buildings occupied only 188 acres. The color scheme was in charge of F. D. Millet. The individual buildings were classical, even for the most part, archaeological, but they were well composed, and in good taste. One, the Transportation Building by Adler and Sullivan, was purely modernistic, a radical departure from precedent, but successful one. Its architects, feeling that they had a new problem on their hands, discarded all details suggested in any way by historical styles, preferring to invent new forms to express the new purpose. The result was a direct ancestor of the more modernistic work of the present day.

East St. Louis, Mo. Cahokia Power Station.—One is apt not to think of beauty in connection with a power plant, but this building proves that it can be attained without losing sight of the purpose of this work. Mauran, Russell, and Crowell as consulting architects, and McClellan and Junkersfield, the engineers, have stripped their work of all ornament in the common sense of the word. The mass of concrete relieved by tall windows and narrow buttresses is left as unadorned as possible, and the four pairs of colossal chimneys leave one with a feeling of immense strength. The whole seems to embody the spirit of the machine.

Hartford, Conn. The State Capitol.—An exception among buildings of this purpose in that it uses the Gothic style. Designed by R. M. Upjohn, the façade is divided by pavilions at the center and the wings. Two low towers flank the central portion which is dominated by a cupola on a high drum. While the details exhibit the dry quality so common in Gothic buildings of the last century, the general mass shows a fine sense of composition.

Havana, Cuba. Trinity Cathedral.—In the Episcopal Cathedral of La Santissima Trinidad, B. G. Goodhue has shown himself a complete master of Spanish architecture. Feeling that style to be appropriate, he has used the richest ornament in the central part of the composition, set off by other surfaces which are left absolutely plain and unadorned. Though not large, the cathedral is impressive by its monumentality of proportions.

Hingham, Mass. The Old Ship Meeting House.—The first church built in 1681 has been

very much expanded. It cost about $2,150 originally. The building was set up by ships' carpenters and some of the massive beams may still be seen in the attic of the present church, hewn by hand. Their size shows that each of them must have required a single tree from which to cut them. The church is rectangular in plan, and is simple in the extreme, both inside and outside. Surmounting the roof is a small belfry and "lookout" from which the church took its name.

Indianapolis, Ind. Soldiers' and Sailors' Monument.—This is one of the most remarkable structures in the city, and was erected from the design of Bruno Schmitz of Berlin to commemorate the part borne by Indiana in the Civil War. About the base are to be seen allegorical figures representing peace and war, and near the monument are smaller bronze statues of Gen. George Rogers Clark, Gen. William Henry Harrison, Oliver Perry Morton, and Governor James Whitcomb. The corner stone was laid on August 22, 1889, in the presence of President Harrison. The monument is about 265′ high and cost over $222,000.

Kansas City, Mo. Memorial.—H. van Buren Magonigle won the competition for this memorial, held in 1921. His design at that time consisted of a large bowl set on a high shaft with lower buildings flanking it, the whole set on a wide base. From within the bowl or censer issues the "Flame of Inspiration, guarded by the Spirits of Courage, Honor, Patriotism, and Service burning forever upon an altar high erected in the skies." The four virtues, the tips of whose wings support the censer, are embodied in figures of an architectural character. The shaft itself is emphasized by marked vertical shadows, but bears no trace of historical precedent. By the time of the dedication in 1926, the base motive had been simplified, and made more striking than it had been originally. It now consists of a huge wall, 500′ long and 50′ high, decorated with a colossal frieze 400′ by 13′. This sculptural adornment, designed by Edith Magonigle, the architect's wife, shows the Spirit of America gathering under her wings the children of the centuries. In very flat relief the great figures of the world's history from the earliest times may be seen in stately procession—the Pharaohs of Egypt, the monarchs of Assyria and Persia, Buddha, the Nativity of Christ, rulers of the Han dynasty in China, and a host of others. Almost Assyrian in spirit, the frieze has the greatest architectural value. The composition of the whole is further enhanced by mural paintings by Jules Guerin.

Lancaster, Mass. Church.—Although he was never personally in the town, the church was designed by Charles Bulfinch whose drawings seem to have been sent to Lancaster from which the church was built by local workmen with local materials—the native brick being employed. It is one of Bulfinch's best churches with a simple arched portico adorned with a pilaster order, and with a small cupola in exquisite proportions and taste. The interior of the church has a gallery on three sides and a pulpit on the fourth whose delicate carving is among the best of that period.

Lincoln, Neb. State Capitol.—B. G. Goodhue has departed far from the beaten track in designing a building for this purpose in the modern spirit instead of using the well-tried classic form. The result has been wholly successful. The competition was held in 1920, and the tower in the center was finished late in 1930. It is 400′ high, and is surmounted by a statue of the *Sower*. The building is 437′ square with four interior courts. The plan is extremely practical in addition to the originality. On the exterior, massiveness strikes the keynote, but is most happily combined with the American tradition of refinement. The sculptural decoration by Lee Lawrie combines harmony with architectural lines, and symbolism recalling the background of the state; its pioneers, its dependence upon agriculture, its buffalo, and so on.

Los Angeles, Cal. City Hall.—A noble, impressive municipal building. The base of the building is 250′ x 430′; its average height is 400′, and contains 28 stories. Its first four floors are faced with California granite, and all of the exposed wall surfaces above that point are faced with terra cotta of a color harmonizing with the granite. The associated architects were: John C. Austin, Albert C. Martin, and John Parkinson.

Medford, Mass. Isaac Royall House.—One of the best examples of 18th century colonial architecture, the building seems to have been erected during the 18th century. The present east front dates from 1733–37, but the bulk of the house including the interior is to be dated from 1750. Its woodwork was carved by William More. Royall was caught in the siege of Boston and later went over to England, but the house was used by Colonel Stark during the siege of Boston. The interior, which is now kept open to visitors, is appropriately furnished in the character of the period.

Mountain Lake, Fla.—Bok Singing Tower, The.—A beautiful tower, fifty feet wide at the base, approximately two hundred feet high, built in a single, simple unit, to sing of music, sculpture, color, architecture, landscape design and the arts of the workers in brass and iron, ceramics and marble, and stone, each a part of a chorus, each adding beauty to the other. The architect was Milton B. Medary, and the sculptor, Lee Lawrie.

New Haven, Conn. Harkness Memorial.—James Gamble Rogers was given almost unlimited funds to produce this work, and it must be admitted that the result justified the expense. It was the gift of Mrs. Stephen V. Harkness in memory of a son, and as a memorial to the famous sons of Yale. The corner stone was laid on October 8, 1917, and the work was completed in 1921. It is a dormitory, accommodating 630 students, on a plot 354′ x 415′. The style is collegiate Gothic inspired by the English universities of Oxford and Cambridge. A series of courts of different sizes creates a feeling of informality and gives charm to the whole. The larger courts are named from previous locations of Yale college; Branford court in the center, and Saybrook and Killingworth to the north. The northern wings of the building are higher than the southern in order to make the best possible use of the sunlight. Over 3700 windows

are included, but in spite of this, the rooms and hallways are none too light. The entry system is used throughout. Everything has been done to give a free hand feeling to the design; and to create a feeling of age, old bricks are used, tiles chipped and battered to stimulate moss growth, and thresholds hollowed as if worn by many feet. Much more important is the carefully studied dissymmetry of the work in every part, but each is well composed and balanced none the less. Beside the main entrance stands the Harkness tower, a fairy-like Gothic creation 216′ high, while diagonally across the court is the Wrexham Tower inspired by the church of St. Giles, Wrexham, Wales, where Eli Yale is buried. In its walls is incorporated a stone from St. Giles Church. The Wrexham Tower uses a gray stone with Indiana limestone trim, but elsewhere, in Linonia court, bricks have been used with stone. However, the bulk of the building is of seam-faced Plymouth granite with Briar Hill rust veined sandstone trim. The color has been skillfully varied, growing lighter as it rises from the ground till the upper part of the Harkness tower is quite creamy in tone. In addition to the material, the style has been cleverly varied, no single entrance duplicating another and one of them, Mason entry, even using Jacobean (Early Renaissance) ideas. These subtle informalities give a living quality to the whole work, and make it one of the most charming buildings in the country. Lee Lawrie and the other sculptors employed have caught the same spirit in the sculptures on the Harkness tower and the innumerable brackets and such incidental works. In its sculpture high and noble ideals, portraits of famous Yale graduates, which, one is glad to note, include heads of the architect and of his assistants, secular and athletic themes and even humor have been treated with real Gothic abandon.

New York, N. Y. American Radiator Building.—In this building, designed by Raymond Hood in 1924, the architect has shown great daring by making the mass of the building black with details picked out in red and pure gold. Believing correctly that the mass of the building would be more telling if the windows did not seem like black spots, he deliberately chose this method of overcoming the contrast of windows and wall as far as possible. The lower stories use polished black marble, while black brick forms the wall surface for most of the building. The form of a tower was deliberately chosen for the more successful architectural effect in spite of a certain sacrifice of floor area. Some details of the bronze entrance are inspired by Gothic, but the rest of the work is affected directly by the New York Zoning Law, the result being a series of setbacks, affording contrasting masses of diminishing size at the top of the building. The interior contains iron work of great beauty. The structure was designed with extreme rapidity, the steel work being begun before the upper part of the building had been completely worked out.

New York, N. Y. Barclay Vesey Telephone Building.—Completed in 1926 by McKenzie, Voorhees, and Gemelin. Few buildings have had a greater influence on contemporary work than this massive pile which is built on a rhomboidal lot. The architects have considered that whereas in previous times buildings were constructed and decoration worked out by hand, modern life is far more dependent on the machine. They have therefore used a different technique to express this fundamental change. The vertical lines of steel columns rising from the basement to the roof have been emphasized, more for the sake of unity of design than for expression of structure. The cornice has been omitted since it would interrupt this harmony of vertical lines, and its place taken by decorated stories with setbacks. This was not the first time that the cornice had been omitted in a modern skyscraper. All ornament is kept flat, and simplified, again suggesting the machine origin. Nevertheless Ricci and De Cesare, the sculptors, have been able too retain a basic naturalism in this ornament without losing the guiding principle of the building as a whole, and the same is true of the color decorations within by Mack, Jenney, and Tyler. All details down to the lighting fixtures and the furniture show the same feeling. N. C. Wyeth has provided a fine series of mural paintings. Much of interest was discovered during the excavations for the foundation. A hull of an old whaling boat and a hollow wooden water main of Dutch origin were the most unusual objects, but hundreds of coins and small things of that sort also came to light. The building, 212′ x 255′, houses 6500 persons. This creates a serious transportation problem during rush hours when an elevator must leave the ground story every five seconds and 180 people a minute must be taken to their offices. The building provides 850,000 square feet of usable floor space with one telephone for every 60 square feet.

New York, N. Y. Bowery Bank.—That suggestion may be taken from the historical styles and used successfully in a modern building has been proved by this splendid work on 42nd Street. Here in the great arched portal, dignified by colonnettes whose surfaces are enriched by spiral flutings and network, the architectural student will have no difficulty in recognizing the Lombard Romanesque origin of the design. A comparison with the Cathedral of Verona will prove the point, but at the same time, the work has greater refinement than most of the old examples, and is used in such a way as to produce a modern effect. The lower portion, serving as a base to the superstructure, expresses its function well in the broad, solid wall surfaces left largely undecorated. On the interior the marble shafts support capitals which hark back to Byzantine prototypes, as do the grills and the mosaic floor, but again it must be admitted that the total effect is modern and that the banking hall is one of the finest in the city, a work which redounds to the credit of York and Sawyer, the architects.

New York, N. Y. City Hall.—Built in the early Republican or Federal period, this venerable building by Joseph Mangin and John McComb is one of the finest to be found in this city. A two storied building, it is surrounded by the towering bulks of the Woolworth Building, the Municipal Building, and so on, but retains its dignity none the less. Strongly influenced by the French as we may see in the tall win-

dows and the formal rustication, it is divided by a projecting pavilion in the center with superimposed orders of columns, and with salient wings at the ends in which a pilaster order is employed. The axis is further dignified by a small cupola.

New York, N. Y. Grand Central Terminal.—One of the high points of American architecture of today is the design of our railroad stations. The difficulty of the problem is enormous and its success is the more striking in consequence. The terminal station of the New York Central Railroad, which also houses the New York, New Haven, and Hartford Railroad, covers an area of thirty blocks in the heart of the city, facing on 42nd Street. The station is used daily by literally millions of people who must catch trains in a hurry, but in spite of this, there is no confusion, no excitement, and as little noise as possible. The great hall is simple architecturally, covered by an elliptical plaster vault, painted blue and decorated by the signs of the Zodiac. The exterior, employing the Doric order modified by French ideas, is less successful than some other stations, especially in the sculptured group on the façade facing down Park Avenue, which represents Progress, Mental Force, and Physical Force. These figures are certainly disturbing in scale, but as a whole, the building acts as a fitting gateway to the city. The building supports an overhead street. It was designed by Warren and Wetmore in 1913 and cost $180,000,000.

New York, N. Y. Statue of Liberty.—One of the largest statues in existence is the figure of Liberty Enlightening the World given to the people of the United States by the people of France. The colossal bronze is the work of the French sculptor Frederick August Bartholdi. It was erected in 1886 on Bedloe's Island in New York harbor, where it is passed by all the boats entering or leaving New York. It is the figure of a woman, clad in a Greek tunic, and mantle, bearing aloft a torch in her right hand. From the top of the statue, which is 151′ high and stands upon a pedestal 155′ high, a fine view may be obtained.

New York, N. Y. Metropolitan Life Insurance Tower.—For a while this building held the honor of being the highest in the world intended for shelter. (The Eiffel Tower in Paris is higher, but is merely for observation.) The tower is 46 stories high, rising 700′ above the sidewalk. The floor area available for use amounts to about 25 acres, a whole village in itself, though far surpassed by some of the larger modern buildings. A lookout balcony, 660′ above the sidewalk may be reached either by elevator or by ascending 1,057 steps. Just below this platform on all four sides of the shaft is a colossal clock, 25½′ in diameter. During the night, colored lights mark the quarter hours, and in the daytime, the "Cambridge" chimes are rung on the four colossal bells cast by the McNeely Bell Company, in Troy, New York. The walls are of marble. The design seems old fashioned at the present day, being obviously based on the bell towers of North Italy. Le Brun and Sons, by grouping the tower windows in threes with heavier shafts between each group, attained far more emphasis on the vertical line than was to be found in most buildings of its time. Nevertheless, this good beginning was somewhat neutralized by the strong horizontal line of the lookout balcony with its arcade.

New York, N. Y. Metropolitan Museum.—This, the largest museum in the country, has been developed since 1879. It is placed in Central Park, facing 5th Avenue opposite 82nd Street. The original building by Vaux and Mould was Victorian Gothic, and has been almost entirely concealed by later construction. Even part of the first additions to it, made by Tuckerman, with a granite basement and brick superstructure are almost invisible today. Here, though the rapidly expanding collections have always demanded more space, it has been impossible to sacrifice at any time the old work, so that no architect can be credited with the design as a whole, but only with the part which he designed. The façade on 5th Avenue, built in 1902 of gray Indiana limestone by R. M. Hunt, uses the Beaux Arts version of classic architecture, with large arches and columns employed to good effect. Among the most recent additions to the building, we may mention the fine wing designed by McKim, Mead, and White for the exhibition of classic sculpture, an ideal hall for the purpose, employing color in a most satisfactory way and using a Roman Doric order around the lighted court. The same architects designed the library. Still more recent is the American wing, in which original colonial interiors have been appropriately furnished to produce a surprisingly fine effect. The tendency to preserve our own delightful colonial work, as shown especially in this wing and the corresponding one in Boston, proves the high esteem in which we hold our past. It is difficult to find more satisfactory places in which to study American colonial interiors.

New York, N. Y. J. P. Morgan Library.—Although not at all a large building, McKim, Mead, and White have succeeded in producing a gem of American architecture in this little building on East 36th Street. Unlimited means were at the disposal of the architects who had the masonry cut with Greek precision, and joined together in the Greek fashion without mortar. As in many small museums, the entrance is treated with a motif Palladio, its dark shadows contrasting with the plain wall surfaces on either side. All proportions are worked out with a refinement, dignity, and beauty worthy of the treasures the building contains. In addition to a few very choice pictures, the marvelous collection of illuminated manuscripts is probably the finest in the country.

New York, N. Y. Pennsylvania Station.—Completed in 1910, this terminal houses the Pennsylvania Railroad and the Long Island Railroad. The plan is less successful than that of the Grand Central. It is decidedly difficult to meet trains because of the several exits, and the long promenade between the street and the main hall is a waste of time and space. On the other hand, the hall itself, and the façade are magnificent creations in the classic style. An inspiration from the Baths of Caracalla in Rome is obvious, and the work has been unfavorably criticized from that standpoint. Whether or not

AMERICAN UNIVERSITIES

1 University of Minnesota, Minneapolis, Minn. (Administration Building). 2 Harvard University, Cambridge, Mass. (Widener Memorial Library). 3 University of Chicago, Chicago, Ill. 4 Princeton University, Princeton N. J. (Dormitories with Blair Hall Tower in distance). 5 Stanford University, Palo Alto, Calif. (Memorial Chapel). 6 Washington University, St. Louis, Mo. (Main Entrance). 7 University of California, Berkeley, Calif. (Sather Gate). 8 Columbia University, New York City (Aerial View). 9 Yale University, New Haven, Conn. (Sterling Memorial Library).

that monumental form would be suited to a bath seems questionable, but there is little doubt of its satisfactory nature as a railroad terminal. The lofty groined vaults, decorated with coffers, serve to swallow the noisy confusion of hurrying masses. The building has an area of 300,000 square feet with a front 430′ long. McKim, Mead, and White were the architects.

New York, N. Y. Public Library.—This institution, formed by the union of the Astor, Tilden, and Lenox libraries, is the second in size in the country, and one of the largest collections in the world. The building by Carrère and Hastings was completed in 1910 facing 5th Avenue between 40th and 43rd Streets. Bryant Park at the rear affords ample space for expansion in the future. The building is of white marble in the classic style. Accented central and end portions are connected by links having engaged Corinthian columns. The central portion is a trifle heavy, and it is interesting to observe that Mr. Hastings is planning to improve this condition at his own expense. The dimensions are 366′ by 246′ with the cornice raised 68′ from the ground in front and on the sides, and 98′ at the back. Two courts 80′ square provide excellent light in the interior. The main reading room is placed on the third floor at the rear of the building, which makes it too difficult to reach from the entrance. It is placed directly over the stacks with a delivery desk cutting across the center, thereby marring the effect, and preventing the true size of the room from being appreciated. Its dimensions are 395′ by 75′ and 50′ high, a truly magnificent hall. The New York Public Library contains over two million volumes.

New York, N. Y. Cathedral of St. John, the Divine.—The church, like most of the great churches of the past, has already taken many years to build, and will take many more to complete. The corner stone was laid in 1892 on a site at 112th Street and Morningside Drive, a dominating location on a hill. The original designs by Hines and La Farge showed elements of many styles. The great granite columns of the choir, more than 50′ high, recall certain examples of Romanesque in Burgundy, such as the great abbey at Cluny. The low brick dome of the crossing is perhaps more nearly Byzantine than anything else. Nevertheless, the interior was undeniably impressive, perhaps simply because of its size. Many people disliked the work, however, and the building has been turned over to Cram and Ferguson who are erecting the nave, and plan to change the style of the choir to Gothic with a magnificent Gothic lantern over the crossing. The nave will be five aisled, taking suggestions from the cathedrals of Bourges and Le Mans, but in no sense imitating either. The sexpartite system of vaulting is used on the interior, and is expressed by paired buttresses on the exterior. The façade will reveal the five aisled plan of the church with flanking towers again inspired by French Gothic. The baptistry has a vault carried on a star-shaped arrangement of ribs such as we may see in some Spanish buildings. In the chapels flanking the apse, various styles of architecture from Romanesque to Renaissance have been completed, and create an element of variety.

New York, N. Y. St. Patrick's Cathedral.—The Roman Catholic Cathedral was built between 1858 and 1879 by James Renwick at a cost of over two million dollars. Renwick adopted French rather than English models of the fourteenth century for this cathedral on 5th Avenue. The two spires of marble flanking the façade suggest the origin. Within are 70 stained glass windows remotely derived from Chartres, and also several altars resplendent with marble and gems. Though not entirely lacking the frigidity of much work of the period, the church is the largest and one of the best examples of the Gothic revival in this country.

New York, N. Y. St. Thomas Church.—The last work of the combined firm of Cram, Goodhue, and Ferguson, this church is surely one of their best. When the old church burned, August 8, 1905, the rector felt the need of continuing services as soon as his parishioners should return from their summer places. A temporary church was erected by October first. The problem of the new church was to provide room for 1700 people in addition to a chapel and other subsidiary rooms, and all on a lot of 235′ x 100′. The exterior is of white to gray violet limestone, while the interior is yellowish. The nave is wide, with narrow aisles to the side, and a gallery is used to increase the seating capacity. The inspiration has been most fortunately derived from Flamboyant Gothic. The sculpture on the church is symbolic, taking in themes of recent American church history, and the stained glass will complete the scheme.

New York, N. Y. Shelton Hotel.—This splendid structure by Arthur Loomis Harmon was designed to combine the functions of a club and a hotel. Its design won the gold medals of the American Institute of Architects and the Architectural League of New York, and its influence has been rapid, widespread, and beneficial. The building accommodates 1,200 guests. It is luxuriously appointed inside with a swimming pool, squash courts, bowling alleys, roof gardens, and so on. Those stories which accommodate these larger elements are suitably characterized, whereas the bulk of the building naturally is composed of suites of rooms with small windows so that the building must be effective chiefly by its mass which is splendidly proportioned. The vertical is further emphasized by a slight, but noticeable batter in the lower walls. The building above the two lowest stories is brick and magnificent in its simplicity. A base is formed in stone in the lower stories with an arcade and details which suggest Lombard Romanesque precedents.

New York, N. Y. Trinity Church.—The first important church of the Gothic revival in this country was designed by Richard Upjohn, the founder of the American Institute of Architects. The work was finished in 1846 and, standing in lower Broadway at the head of Wall Street, its 284′ spire was for long a landmark of lower New York. Today, instead of being the highest point in the vicinity, it is lost among the great buildings, but retains its dignity none the less. The inspiration has been derived from

Perpendicular Gothic. The reredos and bronze doors are noteworthy.

New York, N. Y. Woolworth Building.—For a long time, this tower, built by Cass Gilbert in 1913, was the tallest structure in the world intended for occupation. 57 stories rise above the pavement and dominate the City Hall and its surrounding park; (on clear days, a view of 50 miles radius may be had from the top). The detail is unmistakably Gothic and was deliberately adopted because of its emphasis on the vertical. The tall steel shafts supporting the floor and the wall were cased in terra cotta which is fireproof and easily molded. Although built before the Zoning Law was passed, the mass has somewhat the setback effect, and has a tower, which is small in comparison with the ground area. In the vestibule may be seen brackets adorned with portraits of the architect, the owner, and others, by Donnelly and Rice.

Philadelphia, Penn. Independence Hall.—This fine old colonial building was designed by Andrew Hamilton, 1731–35. The fine proportion of the building and the relation of its parts are typical of the eighteenth century in this country. It was the seat of the Provincial Government. Within its walls, assembled the Second Continental Congress of 1776 which adopted the Declaration of Independence. Upon the walls are portraits of many of the signers, and the building contains many interesting relics, including the Liberty Bell.

Philadelphia, Penn. Athletic Club.—Mass is emphasized by Zantzinger, Borie, and Medary in this powerful and thoroughly modern design. The color, too, shows a daring freedom from precedent by employing salmon pink as a ground tone. Although not controlled by the Zoning Law, the building breaks back in large blocks and gives a setback effect. Decoration in the old meaning of the word is almost completely lacking. The building, of course, houses many different functions all of which are adequately provided for.

Philadelphia, Penn. Art Museum.—This recently completed structure must be counted among the triumphs of American art. Trumbauer, Borie, and Zantzinger have boldly used colors with full intensities, with great success. Like most museums, the classical style has been employed, but with more than usual exactness. The central motive, with its prostyle temple front of eight columns, is repeated on a smaller scale as terminal motives for the projecting wings. Moreover, an attempt has also been made to avoid the lifelessness of many modern classic buildings, by adopting the extremely subtle curves in every line which the Greeks employed in the Parthenon and elsewhere.

Philadelphia, Penn. Girard College.—One of the best examples of the classical revival in this country, corresponding in historical importance to the Madeleine in France. As usual in the neo-classic period, the imitation of the past was so servile as to result in cold productions, generally ill adapted to their purposes, and as different as possible from modern standards. The work is in white marble, using the Corinthian order on a peristylar plan. It is set on a stylobate after the Greek custom rather than on the high platform or podium of the Romans which was employed in the Madeleine.

Santa Barbara, Cal. Mission.—One of the best examples of our colonial work in the southwest. The mission was established in 1785, though the present building dates from 1815–1820. Simple wall surfaces with small windows, towers of simple form flanking the façade show the Spanish origin modified by local conditions. The building is further adorned by six engaged Ionic columns supporting an entablature and pediment. The work is in sandstone and measures 175′ x 40′. Among the interesting tombs the church contains, may be mentioned that of Fr. Francisco Garcia Diego y Moreno, first bishop of California.

San Diego, Cal. Panama-California Exposition.—Although a local affair, this exposition of 1914 attracted a great deal of attention and partially eclipsed the more ambitious attempt of the same year in San Francisco. The choice of B. G. Goodhue as consulting architect was ideal in every way, and to him was entrusted the design of the permanent buildings. He desired to express the historical background and possibilities of the region. For that purpose, the Hispano-Mexican style of architecture was adopted with its brilliant tile domes, and its plain wall surfaces contrasting in the sharpest possible manner with sparkling exuberant decoration. The chosen site of 1,400 acres was separated from the city by a deep ravine, which was spanned by the Cabrillo bridge 135′ high. Absolutely devoid of decoration, the bridge depends upon its repeated arches and upon the richness of the California State building for its effect. These two are by Goodhue himself. Of the other works from this exposition, we may mention the New Mexico building by Rapp and Rapp as an example of the possible variety within the scheme. Here the inspiration was taken from the old Franciscan missions of Acoma and San Felipe, which had in turn taken hints from the adobe constructions of the Indians, notably the beams projecting from the walls which cast sharp shadows.

Santa Fe, N. M. Museum of Art.—Rapp and Rapp adopted the historical architecture of the region for the design of this building in 1917. The old Franciscan Missions at Acoma, San Felipe, Cia, Santo Domingo, Santa Ana, and others, provided the basis. They are themselves influenced by Indian pueblos in the direction of very heavy walls, massiveness, and the clearly cast shadows of beams protruding from the wall. These elements may seem crude at first, but they have a basic simple vigor that is both refreshing and appropriate. The color, which was pinkish brown on the exterior, was a little raw at first, but has toned down satisfactorily. Within, the color is still stronger, but effective. The ornamentation throughout is inspired by Indian motives.

San Francisco, Cal. Panama-Pacific Exposition.—Here the exposition was planned in celebration of the completion of the Panama Canal, and while more lavish, more extravagant than the smaller one at San Diego, its architecture was on the whole somewhat less distinguished. The site chosen enriched the city by increasing the area of the improved land. Extravagance

and ornateness were obvious. The lighting was concealed and well handled, especially in the Tower of Jewels by Carrère and Hastings which sparkled at night with 125,000 cut glass prisms. It rose 435′ in the air. By day it was less successful because the horizontal motives were overemphasized for so tall a building. The Triumphal Arch of the Rising Sun by McKim, Mead, and White was larger than the Arc de l'Etoile in Paris. The Auditorium seating 120,000 people was built at a cost of $1,000,000. Low domes almost Byzantine in effect were extensively used for the exhibition buildings. Perhaps the best part of the exposition because of its refinement, was the Court of Four Seasons, with its enormous niche, 100′ high, designed by Henry Bacon.

San Francisco, Cal. Telephone Building.—In the Pacific Telephone and Telegraph Building, the architects Miller and Pflueger have used full intensity colors on the interior with a happy result. The building rises 26 stories to a height of 436′. It demonstrates the setback principle. Originally Gothic detail had been designed, but considerations of expense enforced the adoption of a more modern treatment. Hence all detail expresses the machine origin.

St. Louis, Mo. Southwestern Bell Telephone Company.—In this huge structure, the light wells and setbacks form the basis of the design. The latter are skillfully varied in height and depth to produce an interesting silhouette to the pile without losing the basic harmony of shape. The vertical lines are emphasized throughout, a heavy pier alternating with a light one, and nowhere broken by horizontals. Mauran, Russell, and Crowell were the architects.

Salem, Mass. The House of the Seven Gables.—This, one of the most venerable of American houses, was probably built in 1669. The clapboarded exterior, the lack of decoration, the large open fireplaces bring to mind at once life in the Puritan days. One of its doors, too, shows the old form of solid planks still further strengthened by hob nails arranged in a diamond pattern. The building has been made memorable by Hawthorne's famous novel. He knew the house well, having passed many nights under its roof, but several elements mentioned in his book were taken from other contemporary dwellings. In addition to the "House of the Seven Gables," Hawthorne's "Grandfather's Chair" had its origin here.

Smithfield, Va. St. Luke's Church.—Few people realize that the early architecture of this country is essentially medieval, or that we have a Gothic church belonging to the original tradition. However, when St. Lukes, Smithfield, was begun in 1632, the Renaissance movement had not yet penetrated beyond the upper classes in England. In the country and among rural populations, Gothic of a sort was still the rule. This brick building by Joseph Bridger is the oldest existing building of the English settlements in America. Pointed arches appear with tracery. The church was in continuous use till 1836, and has been restored since 1884.

Washington, D. C. The Capitol.—The inception of this building belongs to the 18th century. On it, several of our most distinguished early architects were employed. Thornton, Latrobe, Bulfinch, and Hallet, for example. The original building was to have been far less extensive than the present structure, and the dome lower. The style is classic, and the general type, with a large dome rising high upon a drum, created a standard form which has been followed by the great majority of state capitols. Walters was the architect of the dome. The cornerstone of the capitol was laid in 1793. The structure consists of two stories rising from an appropriate base. The ground plan is a central pavilion with north and south wings. The principal façade to the east is dignified by a Corinthian portico, 30′ high, while the same order is continued in pilaster form along the wings. Over the eight projecting central columns, the pediment, said to have been designed by John Quincy Adams, represents Liberty attended by Hope and Justice. The Rotunda, under the dome, measures 96′ in diameter, and is 180′ in height. It is decorated with paintings and has reliefs with subjects pertaining to our national history. Gilded pilasters dividing the paintings serve to support the dome.

Washington, D. C. The Lincoln Memorial.—A distinguished architect has termed this monument "the finest thing in America for pure beauty." It is a fitting monument for Lincoln, and more need not be said. The architect, Henry Bacon, was awarded the gold medal of the American Institute of Architects in 1923, the year after the building had been completed. Adopting a Greek temple form in plan, he has modified it in elevation by the substitution of a simple and solid mass above the entablature, instead of the gable roof ending in pediments. The severest of the classic orders, the Greek Doric, has been employed, and the frieze has been modified by the introduction of the coats of arms of the states. All the proportions are most subtly worked out with a refinement worthy of the master who designed it. Within, the calm statue of Lincoln by Daniel Chester French looks from his chair, set upon a pedestal, down the thousand foot lagoon to the Washington Monument and the Capitol. At either end in the interior are the Gettysburg Address and the Second Inaugural in letters of bronze, while above them some well designed murals by Jules Guerin add a note of color to the whole.

Washington, D. C. Washington Monument.—A white marble obelisk 555′ high and 55′ square at the base is placed in the mall at Washington. The corner stone was laid in 1848, but work was not completed till 1884. The states of the Union, and many foreign governments contributed blocks of stone with inscriptions on them, which have been placed on the walls of the staircase on the interior. An elevator also makes the ascent to the top from which a fine view may be had from the paired windows on each face of the shaft. Aside from these windows, the shaft is absolutely plain.

Washington, D. C. The White House.—The competition for the Presidential mansion was won by James Hoban in 1792. It is a two storied mansion with a portico of eight Ionic columns in front, and at the rear, a colonnade of six Ionic columns. The house was first oc-

cupied by John Adams in 1800. After its destruction by the British in the war of 1812, it was rebuilt, and again ready for occupancy in 1818. The grounds include 75 acres.

Westover, Va. House.—A splendid example of the southern colonial style of the eighteenth century. A product of just the same racial conditions which produced the colonial of New England, the climate has suggested certain changes. The chimneys are placed at the sides of the house. The out-buildings are separated from the main structure, and the whole effect is expansive. A desire to get rid of heat rather than to retain it stands at the bottom of such work. The present building was built in 1749, the earlier houses having suffered by fire.

PAINTING

EGYPTIAN PAINTING

In Egypt, painting was, when possible, kept subordinate to sculpture, though where the scale suggested it, or the patron could not afford the latter art, he might accept painting as a cheaper substitute. Its chief function was to enliven the sculpture, and make more legible the reliefs in the tombs representing the innumerable actions of daily life and of the life hereafter. The colors were very simple, the most important being a brick red for the men and a light yellow for the flesh tones of the women. In addition to these, we find black used for the hair, and blue, green, and a few rarer colors for details. However, even when painting is attempted independently, there is no mixing of colors and the pigment is applied in flat washes without any attempt at modelling. Probably the most satisfactory work of the Egyptians is to be found in representations of natural life, some fine specimens of which may be seen in the rock cut tombs at Beni-Hassan and perhaps even more in the decorative patterns which appear as parts of architecture.

CRETAN PAINTING

A considerable number of frescoes of a high degree of artistic merit have been discovered in the island of Crete, and wherever the Minoan civilization penetrated. Although the inscriptions have not yet been deciphered, it is possible to deduce something about this age from the works of art which are superior to the productions of Mesopotamia and Egypt in freedom and naturalism. The artist deals largely with natural subjects—plants and vines—with religious rites and with acrobats leaping over the backs of bulls, which may possibly also have some religious significance. Extraordinary skill in drawing is to be seen, which, coupled with a fine decorative sense and a lack of modelling, produces an effect not unlike the Japanese. Much of the work suggests an interest in marine life both in the frescoes and in the painted vases. Among the best examples may be cited the *Bull Leapers* and the *Blue Boy* at Knossos, the *Cat Stalking a Pheasant* from Hagia Triada, the *Flying Fish* from the island of Melos and the *Octopus Vase* at Gournia. When this art became transplanted to the mainland of Greece in what was probably Homeric times, it fell into a decadence, and the old sureness of touch was lost.

GREEK PAINTING

Few specimens of ancient painting exist, though from the Greek vases we can follow the progress of drawing. The earliest efforts were in monochrome; then, as in Egypt, came the employment of varied palette, but with no pretensions to perspective or to light and shade. The first creative genius who advanced the art was Polygnotus of Thasos, whose works adorned the walls of public buildings, such as the Painted Portico at Athens. His contemporaries, Micon and Panaenus, brother of Phidias, were also famous, and lent their art to architectural decoration. Polygnotus is reputed to have produced in his works a variety of shades from a simple palette containing only black, white, red, and yellow. He won great fame by his figure compositions and correctness of line. The scene painter, Agatharchus of Samos (about 480 B. C.) added to the scope of painting when he discovered the methods of shading and perspective; and soon afterwards there arose what is known as the Asiatic or Ionic school, whose leading exponents were the rivals Zeuxis of Heraclea and Parrhausius of Ephesus, whom tradition credits with most realistic skill. With such meager remains it is difficult to appraise the work of the ancient artists. The Etruscans were undoubtedly inspired by Greek models, and examples of work, such as the tempera painting on the Corneto sarcophagus now in Florence, give us some indication of the beauty and power of the original. Many specimens have come down to us from the later period of Hellenistic art; the greatest number of these are from the buried cities of Pompeii and Herculaneum.

ROMAN PAINTING

Roman painting developed on similar lines to sculpture; it was chiefly decorative and characterized by little originality. Greek models were slavishly copied both in method and technique. Mural decorations are the only extant examples of Roman painting; but we know from literature that frescoes adorned the temples, and the pictures of Roman victories were carried in triumphal processions. The general tendency toward realism is shown in the surviving mural paintings; in such, for instance, as the celebrated *Aldobrandini Marriage*, in the Vatican Library, Rome, and the garden scenes in Livia's Villa ad Gallinas, in Rome.

EARLY CHRISTIAN AND BYZANTINE PAINTING

The two media of pictorial art in use in these periods were mosaic and fresco. The latter was regarded largely as a cheap substitute for the former in which small cubes of marble or glass provided the color. Naturally this medium prevented detailed drawing, but its color effects were remarkably fine. A hieratic quality pervaded the work which enabled a suggestion of religious mystery and dignity to be attained. As in architecture, some of the best work is to be found in the fourth, fifth, and sixth centuries.

In the west a stronger classicism is apparent; in the east a greater hieratic quality. Among the best examples may be cited the apses of the Early Christian basilicas of Sta. Pudenziana, Ss. Cosmo and Damiano, and Sta. Maria in Trastevere in Rome, and the two panels flanking the chancel of the church of San Vitale at Ravenna, which depict Justinian and Theodora with their respective courts in a more or less natural but hieratic fashion. Centuries later, when Byzantine art revived after the iconoclastic controversy, a still greater dignity was attained, though now with figures elongated far beyond their natural proportions. Nevertheless, great decorative beauty was attained in line and color in the mosaics of St. Mark's at Venice, and those at Daphni, to cite only two instances. It is important to realize the great influence this style had on later art in western Europe, many of its conventions and indeed its point of view being at first adopted. The influence of the style was spread by means of illuminated manuscripts and carved ivories.

SIENESE PAINTING

In a very real sense Sienese painting may be considered as the culmination of Byzantine art rather than the foundation of anything new. Its living religion expresses itself in hieratic qualities. The city of Siena considered itself under the direct protection of the Virgin. To the Sienese the Mother of God was the Queen of Heaven adorned with the splendor of royalty. One finds the same conventions here, the same unreal quality, the same distant grandeur, and the raised surface of such parts of the work as haloes, which are found in Byzantine art, but more warmth. In addition to these qualities due to the influence of miniature painting, a calligraphic line is typical of Sienese art. The color is rich and pure with a lavish use of gold for the background, and details, and the total effect, is decorative in the extreme.

The man who stands at the head of the school is Duccio di Buoninsegna. While he is not the greatest draftsman of the school, he stands very high in that quality. His *Majestas*, an altar of many panels on both its front and rear, represents on the front the Madonna enthroned with saints and angels. A rich glow of bronze green and warm gold strikes one immediately. The many heads have an ethereal quality and an air of inborn aristocracy; the former effect is due to the subtle drawing and to the green underpainting showing through the warmer flesh tones, while long delicate noses, narrow eyes, and small mouths contribute to produce the latter characteristics. But perhaps the element which lends most distinction to his style is a superb sense of composition, best exemplified in the rear of the altarpiece. One of his favorite expedients is to balance a single figure against a group, thereby subtly suggesting the importance of the individual. Countless devices serve to accentuate the figure of Christ—a narrow band of dark seen through a half-open door leading to the head of Christ, or slender colonnette, serving the same purpose. Again, the compact group in the *Corruption of Judas* suggests a sense of treachery and shame, even before the subject is recognized. Although the architectural elements of all these panels are out of proportion, their lack of reality is seldom disturbing.

Greater than Duccio in one respect is Simone Martini. There has perhaps never been a greater master of line in Europe, and but few can be counted as his equals. The edge of a drapery may be outlined with the greatest sureness, and with a touch reminiscent of the calligraphic whirls of an illuminator of manuscripts. The linear quality and its possibilities are illustrated in the *Sant' Ansano Annunciation*. The suggestion of motion imparted to the fluttering robe of the *Gabriel* is the result of its lines alone, and how magnificently this is opposed to the startled *Madonna*. Although he is not always above reproach in color, this painting is fine enough to satisfy even the most exacting critic. Simone's influence on later art is greater than Duccio's because, where the latter remained in Siena most of his life time, Simone went out of his native city, notably to Avignon, France, during the papal sojourn in that city, thereby spreading a knowledge of his style far and wide.

The Lorenzetti Brothers, under the influence of the Florentines, became more human and less supremely aristocratic than Duccio or Simone. Ambrogio, the better of these two brothers, like most of the Sienese, was a good draftsman, and a more careful worker than Pietro, but was inclined to be didactic. His feeling is more tender and gentle, and less violent than Pietro's, who sometimes falls into extravagances. If he did not invent, Ambrogio certainly popularized the type of the Madonna embracing the Child, and also that of the Madonna giving the breast; both, one should observe, emphasized the human side, and gained interest thereby, but lost dignity and aristocratic quality at the same time. Of the other Sienese painters, Guido da Siena, Ugolino da Siena, Segna di Bonaventura, Lippo Memmi, Barna Senese, Bartolo di Fredi, Sassetta, and Taddeo di Bartolo are perhaps best worthy of mention. Fortunately the days of popularity of the Sienese school have fallen within the period of American connoisseurship and collecting, and as a result, the country is fortunate in possessing a number of Sienese works. Siena could never accept the new spirit of the Renaissance, nor recover her fourteenth century glories. Matteo de Giovanni, Neroccio de Landi, Peruzzi, Sodoma, and Francesco di Giorgio are well known but vastly inferior to the earlier Sienese painters.

FLORENTINE PAINTING

But if Sienese painting is the culmination of the Middle Ages, Florentine is birth of the new. In matters of feeling, these two schools show almost a complete contrast. Where Siena was aristocratic, Florence was bourgeois; where Siena was hieratic and mystic in her religion, Florence was human; where Siena was content with unreality, Florence strove for naturalism; and to make the contrast complete, they were bitter political rivals. St. Francis of Assisi had lived to stimulate a more passionate, more personal devotion which could not well be expressed by Byzantine formulae. Nevertheless, the first master of the Florentine school,

Cimabue, attempted to do this, and it is astonishing to find that the results are not as futile as might have been anticipated. Although his existing works are largely in mosaic, his few frescoes and panels show a vehemence which shakes the old forms as a powerful new motor will an old automobile. His shortcoming is in the forms which the greater Giotto di Bondone was to discard completely, realizing their inadequacy. The new figures introduce the third dimension, put an air of solidity into the whole, in short create tactile values as Mr. Berenson has termed that impression of relief imparted to the spectator. The frescoes of the Arena Chapel mark an epoch in art. Monumental figures, with a magnificent regard for the main masses, fill the scenes. The individual characters are treated with dramatic vigor, and if they have not the unparalleled linear quality of the Sienese, the breadth of treatment in the massive figures makes amends. The composition is again superb as among all great masters, and each separate figure has a strong personality. Details, like landscape and architectural backgrounds, are merely indicated, and though they have no relation to the human figures, they may be regarded in the same light as the stage settings of Elizabethan drama, or as a script suggesting the setting of the scene. In his later work at Santa Croce in Florence, Giotto polishes and refines the figures of the Arena Chapel. His great contribution of three dimensional form became the watchword of the later school, although for the few generations before the beginning of the Renaissance, except for Andrea Orcagna, that ideal was submerged by the influence of the Sienese school.

Masaccio marks the reversion to the aims set by Giotto. His series of frescoes in the Brancacci Chapel in the church S. Maria della Carmine was little less than a school for many painters of the Renaissance. Although other men like Masaccio's master, Masolino, worked here, and the parts to be ascribed to each have never been exactly determined, the more monumental and vital works are surely by the hand of Masaccio. Such scenes as the *Expulsion of Adam and Eve*, the *Tribute Money*, and *St. Peter Baptising*, show a feeling for the essentials of form and a dramatic power which indicate a great master. Details do not interest this artist, yet no important matter has been overlooked. The figures live; their forms seem to be modelled in relief; the resistless movement of superior bodies is felt everywhere; and throughout, a sober, not to say severe spirit, free from anything trivial or attractive by mere prettiness, imparts a majestic dignity to the whole.

The painters of fifteenth century Florence may be divided into two groups. The first of these we can call the scientists, since they were interested primarily in increasing the painter's ability on the technical side of his art. In this they were eminently successful, and their contributions became the foundation of both contemporary and later work, but it must be admitted that their individual productions tend to be more important historically than aesthetically. So Paolo Uccello is responsible for working out the laws of perspective. He was so devoted to this study that his battle scenes seem deliberately filled with intricate problems of perspective by which to exhibit his skill. We find spears with spiral decorations lying aslant on the ground, horses greatly foreshortened, or hedges following the contours of fields into the distance. Though good from a decorative point of view, perhaps in spite of the accurate perspective, the individual figures are somewhat lifeless. Andrea del Castagno stands for stern truthfulness in the single figure. His physically strong figures are convincing because of their powerful draftsmanship. Their anatomy is accurate. Truculence and boldness stand out from such a figure as Pippo Spano in *Sant' Apollonia* in Florence. Baldovinetti's contribution was in experimentation with media, but the unfortunate result has been the destruction and disappearance of many of his works. Antonio Pollaiuolo, sculptor and painter, studied anatomy, and was empowered to render movement in a more convincing fashion than had been possible before. In his work, each muscle is given its just place. In his panel of *Hercules ana Antaeus*, a careful inspection of the legs of Hercules betrays their carrying the weight of two bodies All these discoveries were epitomized by Verrocchio who is better known as a sculptor, in which field he also summed up the attainment of the century.

The second type of Florentine painters may be termed sentimentalists for want of a better name. They were interested in narrative, in spiritual matters, in monumentality of effect rather than special scientific problems. As a result, their work, though more conservative than that of the scientists, is also more attractive. Fra Angelico has been deservedly popular from his day to the present. What could be more charming than his gaily colored panels with figures of unearthly purity? They seem not to have the virility of the scientific works or to have been exposed to the temptations of the world. Rather a sweet ingenuousness is the basis of their charm. But we should not form our opinion of this painter on the musical angels which decorate the frame of the *Madonna del Linaiuoli*, however attractive they may be. His more serious work was the frescoes in his own convent of San Marco in Florence, and in the Chapel of Nicholas V. at the Vatican in Rome. Here he shows himself to be fully abreast of the times. He is able to conceive figures solidly, naturally; to surround them with details studied from nature; to adopt the Renaissance forms of architecture which were being worked out at the same time. His devout nature shows itself more fervently in the *Crucifixion* in the chapter house of San Marco, or in the little pictures decorating the cells of the monks, than in the ecstatic joy of his gay panels. It is upon these frescoes that his fame must rest, and on them, it will be secure. The garrulous Benozzo Gozzoli in his decoration of the chapel of the Riccardi palace is always amusing, and provides a fine picture of the pageantry of Florentine life. He is the forerunner of the present day illustrators of children's books. In Fra Filippo Lippi, we find again a devout artist. Occasionally his types are tinged with melancholy, but most of his figures, who might readily be seen in the streets of Florence, are more amiable, introducing a youthful

element which gave charm to the whole century. His pupil, Sandro Botticelli, is a far greater artist. The greatest linearist of the Florentine school, he must take his place among the draftsmen of all time. The poetry of his type is lyric, wistful and delicate. It will repel many, since the type seems unnatural. At certain times, as in the *St. Augustine*, he could be powerfully realistic. In his mythological subjects, we find a treatment which, though highly personal, gives something of the fifteenth century conception of antiquity. The spirit is entirely different, and the interpretation quite inaccurate, but nevertheless for its own sake is a jewel without price. As a composer, too, Botticelli must rank with the best. Toward the end of his life, under the influence of Savonarolla, he eschewed mythological subjects and became profoundly religious. His pupil, Filippino Lippi, was strongly influenced by Masaccio. He completed the Brancacci Chapel, and it is high praise to say that he was not unequal to the task. At his best, he deserves a high rank, but toward the end of his life, he fell into extravagances of contortion and cheap sensationalism, which is beneath contempt. Domenico Ghirlandaio has a mind which is not unlike that of Benozzo Gozzoli. His taste for pageantry, for high social life, for display, is no less strong, but a sense of monumentality redeems his work. Though not great, he was a good painter, and we are fortunate to find in his work, paintings of Florence and portraits of most contemporary Florentines. He recorded accurately the Florentine life of his day.

Perhaps Verrocchio's greatest claim to fame as a painter is that the youthful Leonardo da Vinci studied in his shop. In his long life, Leonardo showed himself to be one of the most versatile geniuses the world has produced. He wrote and theorized on the art of painting, in addition to practising it. As a military engineer, civil engineer, musician, poet, astronomer, natural scientist, and mathematician, he was memorable. His point of view was surprisingly modern in its desire to test everything before accepting it. He experimented in aviation. He foresaw the correct theory of the planetary system, and of the transmission of sound and light by waves. His theory in painting he expressed in an emphasis on tactile values, composition having a geometric basis, and the beauty of shadow which tended to subordinate color to tone, and expressed in his figures "the emotions of the soul." The refectory of Santa Maria delle Grazie at Milan has been made famous by the *Last Supper* which adorns the wall. The character of each of the apostles has been studied with scholarly care. The moment chosen for the scene is the most dramatic possible, when Christ says "One of you shall betray me." The reactions of the apostles have been worked out with analytical care. Arranged symmetrically about Christ in four groups, they emphasize Him by gesture and glance. So, too, do all the subsidiary lines of the composition. His head is the center of the perspective lines of the ceiling, and is relieved against a light background. In such other works as the *Madonna with St. Anne*, we find Leonardo using the pyramid as a basis of design as indeed he does also in the *Christ of the Last Supper*. His subtlety may be seen in the *Mona Lisa*. His paintings were approached from a scientific or psychological standpoint. Leonardo was perhaps at his best when he was least conscious of his scientific ability. Leonardo stands just at the beginning of the sixteenth century with its maturity, as compared to the youthful character of the earlier period.

Michelangelo, the restless giant of the Renaissance, though less scientific than Leonardo, and of an irascible disposition, was also versatile. Although his color is not remarkable, his drawing is magnificent. Into the statuesque forms on the ceiling of the Sistine chapel in the Vatican, he impresses his epic poetry, compounded of the disgust and disappointment of a religious and patriotic soul living in a time of which he disapproved. Doing the work almost without assistance, Michelangelo in four years crippled himself and produced one of the wonders of the ages. Its decorative value composed of closely knit figures, nude youths of heroic build, serving as links between the biblical scenes above and the prophets and sibyls below, is a colossal achievement. He drew and painted the figure in any position with great force and accuracy. The big forms have something of the classic strength of their period, but the power within them is Michelangelo's own. His pagan love of physical beauty and his fervent Christianity struggled within him, thereby producing a sense of tension and of burdensome thought. Of the other Florentines of the first part of the sixteenth century, Andrea del Sarto's large, mature forms are typical. Known as the "perfect painter," his technique was splendid, putting his works on a uniformly high plane, but without the stroke of genius to raise them into the realm of masterpieces. For the rest, it is enough to mention by name Fra Bartolommeo, Bronzino (whose strong undercurrent of sensuality does not mar his magnificent portraiture), Pontormo, and Vasari, the great biographer to whom we are indebted for much gossip and more criticism of the artists of his day.

UMBRIAN PAINTING

While the Florentines were devoting themselves to scientific problems, the Umbrians were creating in the realm of space composition, which may be thought of as introducing the third dimension into composition, as expressed in their delicate Umbrian landscapes. The tendency to charm, to sweetness was fortunately tempered by a series of contacts with the more virile painters of Florence. Gentile da Fabriano is still primarily mediaeval, but even in him is to be found the delicacy, the interest in landscape of his school, and the experimental feeling of the Renaissance. Piero della Francesca is geographically Umbrian, but in point of view he properly belongs to the Florentine scientific group. Perspective, science, anatomy, and a scorn for anything soft or pretty make up the foundation of his style on which he builds starkly impressive pictures. The figures are unemotional but the effect of the whole attains high tragedy at times. Melozzo da Forli developed still further the knowledge of perspective and foreshortening which he had learned from his master, Piero della Francesca, as we

may see in his musical angels. Luca Signorelli, another pupil of Piero, seized upon the nude as a vehicle for the expression of movement, and his knowledge of anatomy displayed in the chapel of S. Brixio at Orvieto was a direct forerunner of Michelangelo's work in the Sistine Chapel. Pinturricchio dealt with the cool and spacious landscapes of Umbria, giving his figures the sweet and lovely character which is associated with that school. Perugino emphasizes space composition in his panel of the *Delivery of the Keys to St. Peter* in the Sistine Chapel. Here we find the figures arranged in three definite planes which gives a sense of order and monumentality to the whole. Although his figures are sometimes tainted with sentimentality, their simplicity endows them with dignity and in spite of his atheism, strong religious feeling is maintained.

The culmination of the school comes in Raphael, one of the most genial temperaments who has ever lived. Raphael's contact with Florence saved his art from the excessive softness toward which Umbria tended. A good draftsman and generally, though not always, a good colorist, Raphael's Madonnas have long stood high in popular favor for that charming combination of Florentine strength and Umbrian sensibility which expressed itself in simplicity. He has the distinction of fixing the type of the Madonna just as Phidias established once and for all the character of Zeus and Athena. But Raphael's most solid claim to fame lies in his composition, in which the just and careful relation of the parts is not too obvious, and in which his sense of bigness, of breadth, and classic quality is most clearly to be seen. His frescoes in the Camera della Segnatura in the Vatican must always rank with the world's masterpieces.

NORTH ITALIAN PAINTING

The various schools of North Italy, on the whole, tend to betray strong influence from Florence or Venice. Though Milan, Ferrara, Bergamo, Verona, and a host of other cities could boast individual schools, it is nevertheless proper to group them all under a single head. The University of Padua radiated knowledge of classic antiquity through the vicinity, and even to more distant points. This group of schools, in addition to a host of less important though still interesting painters—Vittore Pisanello, Cosimo Tura, Cossa, Costa, Francia, and Luini, to cite but a few—produced two figures of great genius in Andrea Mantegna and Correggio. The former of these has the accurate drawing and style inculcated by his master, Squarcione, who enforced careful drawing of the antique with a hard quality as though his figures were carved in stone. Nevertheless, with the same means, he attains a feeling for the third dimension hardly paralleled in art. His skill in foreshortening is the equal of Melozzo or Uccello. The archaeologist in him was always killing the artist. In other words, his Renaissance interest in the past became so archaeological that his works tended to be dryly imitative, though at his best he kept this quality well subordinated.

Correggio towered over the sixteenth century in the North of Italy as Mantegna dominated the fifteenth. One looks in vain for Christian feeling even in his well known altarpieces. Rather is his spirit purely pagan. By means of a subtle softening of the outlines by a gradation of tones and color, he attains atmospheric quality expressing femininity. Essentially a baroque painter in many respects, he does not shun the sensual, but rather expresses it with the joy of life, a veiled vitality, and also with the technical facility which marked that much maligned period. The floating figures, those perched precariously on painted cornices or clinging to fleecy clouds astonish us by their baroque character. It is not to be supposed that this man could be at his best in a religious subject, nor did he reach his pinnacle in fresco. But in pagan themes, such as the series of the Amours of Jupiter, he has seldom been surpassed.

VENETIAN PAINTING

Venice, with its contacts in the Orient, inclined to luxury and splendid color. Inasmuch as the school developed late, we find the pagan character strongly marked with its concomitant sensuosity. Add to this a tendency to think in terms of paint rather than drawing, and an oil technique where the earlier Italian schools had used fresco or tempera, and one has by far the most modern painting of the peninsula. The fifteenth century shows, to be sure, more Christian feeling than the sixteenth, but the other qualities may be discerned in the work of Jacopo and Gentile Bellini or in the Vivarini family. Antonello da Messina brings to Venice one of the strongest contacts with the realism and the oil technique of Flanders. Giovanni Bellini sums up this century of Venetian painting as did Verrocchio that of Italian sculpture. At first strongly influenced by Mantegna, he soon passes on to adopt each successive innovation as it was introduced, and to make it an integral part of his style. He is perhaps best known for his many half length Madonnas. His delightful color, his quiet religious types, and a gentle but not effeminate spirit entitle him to the highest rank among fifteenth century Venetians.

Of the four great geniuses in the Venetian High Renaissance, Giorgione was first in date. His paintings are lyric like those of Botticelli, but the religious feeling is displaced by a pastoral note. The landscape background takes a more important position; the figures correspondingly less. Technically, the work emphasizes the painter's qualities more than the draftsman's and by the softening of the outlines, atmospheric effects are obtained. His figures meditate quietly, preferring the world of dreams to that of reality.

During his long life, Titian tried a great variety of subjects, and an almost equal number of methods. He was successful in all. At first he was strongly influenced by Giorgione, whom he probably met during his student days under Giovanni Bellini, but his robust and lucid mentality was quite foreign to dreams. Without any lack of imagination, he is practical where Giorgione was dreamy. In pagan subjects, he may equal Correggio. Titian's paintings are clothed in warm golden light. His prolonged study of each picture, while los-

ing nothing of the freshness, resulted in perfect completion. His truth to nature may be seen in the *Venus* which lacks Giorgione's poetry, but which for pure painting is superb. His religious painting is honest and robust as in the *Assumption of the Virgin* in the Academy at Venice. In portraiture the character is magnificently handled as may be seen in the group of Paul III. and his nephews. Even among Venetians, Titian's color is remarkable. From the pearly flesh tone to the richest reds and greens no sign of timidity is to be found nor a trace of inharmonious work. During his later life, he became interested in cool, silvery tones, and emphasized them rather than warm color.

Tintoretto avowed a desire to combine the drawing of Michelangelo and the color of Titian. To a large extent, he attained this exalted aim. Highly temperamental, and at times unrealistic, he incurred his master, Titian's, disfavor and was expelled from the workshop. But perhaps his most striking success is in the field of composition. The subject is frequently, though not always, placed back of the immediate foreground, as though each spectator were at some distance from the action. In spite of this, so remarkable is the relation of the parts, and so clever the devices which serve to accentuate the action, that, however small the amount of the canvas it may occupy, it first attracts the attention of the spectator. Of such a nature are many of the frescoes in the Scuola di San Rocco. Tintoretto could also compose beautifully in a single plane, as may be seen in the supremely beautiful decorations of the Antecollegio in the Ducal Palace at Venice.

The least important of the four great Venetian painters of this century is Paolo Veronese who, as his name implies, is a native of the town of Verona. Less thoughtful than any of the other three, the splendid pageantry of Venice appealed to him, and he became its recorder. Without any religious feeling, his huge canvases are composed with absolute clarity; hosts of figures are placed in an elaborate architectural setting; the subject is almost forgotten, but a splendid decorative effect is obtained in spite of that. The *Marriage at Cana* in the Louvre is typical.

LATE ITALIAN PAINTING

After the period of the High Renaissance, painting underwent certain changes like sculpture and architecture. At first, no men of genius were found who could carry on the work of a Michelangelo and a Raphael, a Leonardo or a Titian. Many attempted to do so, but on the whole, succeeded only in burlesquing the previous men. So Giulio Romano and Daniele da Volterra repeated the powerful forms of Michelangelo without his force, and used the delicate figures of Raphael to express religious sentimentality. The school of the Caracci brothers at Bologna attempted to combine the most prominent virtues of the greatest men preceding them,—the drawing of Michelangelo and his power, the composition of Raphael, the color of Titian, the sweetness of Correggio and so on. If the combination is possible at all, the task required greater genius than these eclectics could command, but they were successful in passing on the torch of classic quality to Poussin and through him to the modern academies. In decorative compositions, they show the influence of Michelangelo. Their pupils, like Guido Reni and Domenichino, show the ecstatic religious feeling that we fail to understand today, and so, quite unjustly, call insincere. Again the same vigor approaching vulgarity, that is found also in the architecture and sculpture of the time, may be seen in this baroque painting. Another type of baroque painting threw over the ideals of the classic school, turning from the grand manner to the romantic and naturalist point of view, which found its expression in figures from humble life. Caravaggio, the leader of this group, abandoned diffused lighting for the concentrated illumination of the studio with its intense high lights and black shadows. In landscape such a man as Salvator Rosa preferred the wild Abruzzi region for his inspiration. This natural and romantic point of view passed to Ribera, and through Velasquez influenced the impressionistic artists of the last century. Add to these two currents, the portraiture of Titian as the foundation of the portrait style of Van Dyck, and later of the English school, and the strong color of the Venetian school through the same channels, and one may justly claim for the Italians an inestimable part in the foundation of modern painting.

SPANISH PAINTING

Although the Iberian peninsula underwent periods of strong influence from outside sources, its artistic production has almost never been without the Spanish flavor. The Spaniards were by nature perhaps the most aristocratic of peoples. Their figures bear expressions of haughty distinction, a consciousness of superiority which they take as a matter of course. They are, moreover, highly religious or perhaps mystic, extravagantly fervid, intensely ascetic. It is no accident that the militant supporter of the Catholic Reaction was Spain, or that the Inquisition was identified with Spain, or that Loyola, a Spaniard, should have founded the Society of Jesus.

Upon the earlier work of the school, we need not dwell. Fine though the Spanish primitives were, the glory of the seventeenth century completely eclipsed them. Men like Dalmau or Borrassà were pretty strongly influenced by the Flemish School, and indeed a multitude of paintings were imported from the Low Countries. During the Renaissance, the country fell strongly under Italian influence. El Greco, perhaps the first great Spanish painter, was a Cretan by birth, but trained in Venice where his style was markedly influenced by Tintoretto. With perfect deliberation, he chose unnaturalistic figures, the better to embody his mystic and supernatural ideas. He displays the somber distinction, the fanaticism of Spain, but with the Spaniard's love of contrast. So we find him ascetic to the limit, and at the same time alive to feminine beauty of the aristocratic Castilian type. His masterpiece, the *Burial of Count Orgaz*, in the remarkable row of portraits which form the picture's lower half, shows that he can be true to nature. In the upper,

the elongation of the forms are created in order to suggest the miraculous. El Greco's color scheme consists of vivid whites melting into reds and blues. His intensified spiritualizations through color and the attenuated forms have been of inestimable influence on the art of today.

Ribera, trained in the sphere of Caravaggio's influence, adopted the naturalism and black shadows, and combined them with his Spanish intensity. Though at times he may attain greatness, those times are scarce, and he is generally disagreeable.

Velasquez is admittedly the genius of the school. As a painter, he is as nearly perfect as any before or since. His greatness lies in his ability to blend artistic qualities by his subtle technique. No one was ever a greater manipulator of the brush. He is able to suggest all requisite detail, to indicate texture and form with perfect surety. His color, though generally quiet and harmonious, is in excellent taste. Whatever the eye can behold, Velasquez can paint. This influenced the later impressionistic movement. His defect is a lack of imaginative quality which shows itself in his religious paintings. Interior scenes display his phenomenal sense of scale of composition, and of aerial perspective. One feels not only differences in the atmosphere between the foreground and distance of the out of doors, but even within the short dimensions of a room. *Las Meniñas,* and *Las Hilanderas* may illustrate this. His composition is of the finest and yet is never obvious nor academic. Although a single line may not be disturbed, the result seems accidental and effortless. The disposition of the spears in the *Surrender of Breda* is as cleverly varied as one could wish. Nor is he less fine in portraiture. The members of the gloomy Spanish court of Philip IV, probably the most aristocratic in Europe, bear themselves with a dignity which needs no gaudy colors to emphasize its distinction. Therefore, the figures are clothed in blacks and greys with a minimum of display.

Murillo's fame rests on his ability to envelop his figures in soft color. Although he is occasionally inspired to paint the urchins of his native Seville in a naturalistic vein, his more typcal Madonnas and Immaculate Conceptions are distressingly weak in draftsmanship, and the sickly sentimentality soon becomes tiresome.

The eighteenth century produced Goya, an intensely dramatic satirist who can never be condemned for lacking imagination. His court portraits are biting with barely concealed ridicule. Technically, he is far inferior to Velasquez. His color is often hot, but expresses the brilliant Spanish sunlight. He sometimes betrays a note of provinciality by the stiffness of his figures or other defects. Nevertheless, his weird imagination and great technical skill found their fullest expression in his aquatints, many of which are wonderfully horrible and sinister to an extreme. Toward the end of his life, he began to suppress outline in favor of masses, stating his belief in words which might be expected from a nineteenth century Romantic. His influence on that group has been marked.

GERMAN SCHOOL

Generally the Germans employed graphic rather than pictorial means for representation Their greatest period in the Renaissance continued to use a medieval technique. To the results, only the hardest adjectives may be applied. Prettiness, grace, elegance are not to be found. On the other hand, strength and originality are abundantly present. An honest realism gives a note of sincerity, but not infrequently of provinciality. Dürer's power and his thoughtful art won him high praise among the Italians. Solidity of figures and grave reverence find their way into most of his paintings, but he is perhaps even more imaginative in the wealth of engravings coming from his hand. Cranach, the founder of the Saxon School, is a weaker figure than Dürer in every way. He is more of a rustic, but when he attempts subjects from classic mythology, the results are more amusing than satisfactory. Better are the simple portraits in which the sitter is recorded faithfully with great beauty of drawing and color. Holbein has less religious conviction than Dürer. He is, indeed, a cosmopolitan character of the type of Erasmus. He lacks, too, certain traces of Gothic which may be discerned in Dürer's work. Consequently, his religious paintings are quite inferior, but his fame and interest for us rest on the incomparable portraits we have from his hand. These are finished with minute care after the manner handed down by the Van Eycks in Flanders. Extremely sensitive in drawing and color, with the surface polished till it shines like lacquer, the element which raises them to the highest pinnacle of portraiture is the study of character. His exquisite sense of balance in composition is well nigh perfect as in the portrait of *Maria Christina, Princess of Denmark,* and *Duchess of Milan* in the National Gallery of London. With a quite impersonal touch he has made his age live again, and we feel a closer knowledge of Erasmus or Henry VIII because he painted them.

FLEMISH SCHOOL

To discuss the Flemish School, one must begin in the Middle Ages. By far the most important painting north of the Alps before 1500 came from Flanders whose influence spread far and wide and which was indeed the only rival of Italy. Totally different from Italy in almost every way, the divergences may be explained by the patronage to a large extent. The middle class burghers of the low countries were no less religious than the Italians, but their ideal was quite different. The figures of the Virgin and the Child are hardly more naturalistic than the Italian, but the subsidiary figures show an interest in realism which had not been attained so early south of the Alps. Physical ugliness, even deformities, seem to be welcomed to enable the artist to show his ability. A great deal of detail is added, giving a start to genre painting, and creating an interest in landscape. The incidental objects which find their way into pictures have perhaps never received more loving care. The technique was developed to suit this demand. Oils were used, and brush

work was so fine that the strokes cannot be detected by the naked eye. The whole is covered by a series of glazes which keep the surface highly polished. The colors are intense and the figures modelled carefully by light and shade.

The founders of the school were the brothers Van Eyck, of whom Hubert seems to have been the older. Their combined masterpiece, a large polyptych representing the *Adoration of the Lamb*, holds a similar place to the Arena Chapel or Duccio's *Majestas*. The panel representing Christ comes as a shock to most people whose conception of Him is based on Italian models. But in spite of the black beard, we find no less dignity, no less divine character than in the more familiar treatments of the subject. Such a panel as the *Singing Angels* illustrates the realism of the school in its treatment of the different expressions of the singers. Or again, the panels representing *Adam and Eve* have the same realism accompanied by a physical ugliness which was not to be found in the previous example. In the lower half a series of panels show various classes of men approaching to worship the Lamb. Although a direct descendant of the older Paradise pictures of the Cologne school, the treatment of landscape shows an observation of nature and a desire to reproduce it, which had not been manifest in the earlier middle ages. To disentangle the respective share of the work done by the two brothers is a point too controversial to be discussed, but their combined work will stand forever as a landmark in the history of art.

John, the younger of the two brothers, has left a number of other works creating new compositions and details, which were later to become part of the vocabulary of the school. So the arrangement of the *Madonna of the Chancellor Rolin* was repeated frequently from that time on. Or in the portrait of Jan Arnolfini and his wife, we find some of the genre devices again passing into the common knowledge of the school. John Van Eyck was an excellent portraitist, recording the features of a sitter to the last detail, but forcing them to embody or betray the personality behind. He appealed to the mind rather than to the emotions by the dignity and the incisive characterizations of the sitter.

Great as the Van Eycks were, their influence even on Flemish art proper was less marked than that of Roger Van der Weyden, perhaps because they were court painters with but few pupils. Van der Weyden was far less impersonal than the Van Eycks, but if he lacks some of the incisive characterization, he makes up for this by greater emotional spirit. Perhaps also an element of grace, almost of elegance discernible in his style can be traced to his birthplace close to the French border. Certainly these qualities go far to make up his *Deposition* in the Escorial near Madrid with its mourning figures, its sense of restrained tragedy, and the delicacy of some of its figures. His tender Madonnas have more of softness than one would find in a Van Eyck. Fortunately for us quite a few of the latter have been preserved.

Dirk Bouts, though really Dutch, not Flemish, may have preferred to spend his own time on the landscape backgrounds which formed the setting for his works wherever possible. If this is indeed true, he becomes the first man to devote himself primarily to landscape. His figures are inclined to be awkward, betraying a provinciality totally foreign to either Van der Weyden or Van Eyck. Hugo Van der Goes was the temperamental type of painter. He preferred large canvases, in contrast to the taste of most Flemish artists for small ones, and handled them in a big way. They do not look like enlarged miniatures as do so many of the other works of this school. The huge panel done for Tommaso Portinari and frequently called after his name, represents the *Adoration of the Shepherds*. The composition which, though not obvious, is carefully worked out, has been conceived for its large scale and could not suitably be reduced to miniature size. Its monumentality made it peculiarly fortunate that it should be sent to Italy where it stimulated Italian painting at just the right time. Ghirlandaio shows its influence strongly, and its depth of color and shadow soon affected Italian painting. Nevertheless this painting was not the only means of disseminating knowledge of Flemish art in Italy. Justus Van Ghent, having been born and trained in Flanders, moved to Italy and there practised his trade with some success. Though not one of the greatest painters of the school, his historical importance must not be underestimated for his work at the court of Urbino, that center of Italian humanism, inevitably gave new ideas and methods to many native painters.

Hans Memling, though hardly in the category with the Van Eycks, must be mentioned briefly. His shrine of *St. Ursula* is a veritable jewel casket. His work is just as pretty and attractive as it can be with its charming air of make believe in the tragic scenes of the legend. While not powerful, his better portraits have honesty and sincerity which can only be obtained by sympathy with the sitter. Of the innumerable other painters of the time, mention can be made of only a few. Patinir chose to represent landscapes in which the religious subject he had to retain becomes the merest incident in the whole. The landscape, delightful with blues and greens, is the real theme which interested the artist and holds our attention. Brueghel gives us landscapes and also excerpts from peasant life, for which he had a marked taste, foreshadowing some of the later work in the Dutch School. The eccentricity of Bosch reveals his disordered mind but is hardly to be called defective from the standpoint of painting.

The Renaissance came in slowly to the Low Countries, and its advent was not wholly successful at first. Van Orley, to be sure, went to Italy and absorbed enough of the southern manner to seem reasonably at home, but the classicism of a Quentin Metsys is almost confined to insignificant details. Although Mabuse has much more correct notions of the Renaissance, he misunderstood its spirit. His mythological scenes reach the limit of the ri-

diculous when compared with so great an Italian as Correggio. Even his other themes are not very inspiring although the fleshiness of the figures looks forward a century to Rubens. Finally Antonis Mor stands as a transition to the seventeenth century with his stern characterizations of such famous figures as Queen Mary of England and the Duke of Alva.

Peter Paul Rubens is the glory of seventeenth century Flemish Art. The southern half of the Low Countries had remained Catholic, and Rubens was the baroque painter of the Catholic Reformation north of the Alps. The virtues of this movement are to be found in him and also its defects. He is primarily a decorator, thinking out his canvases in the most effective manner. His small works seem to be sketches for larger compositions. This means that a geometric basis for the painting may generally be found beneath the exuberant welter of arms and legs. Vigor is never lacking to him whether he attempts a Deposition or a Bacchanalian Revel. The actors move violently but are hearty and robust. Rubens got his rich color from the Venetians, but the sensuality verging on vulgarity is pure baroque. His heroes are beefy. The same types translated into feminine figures are so foreign to our own ideas that it is difficult for us to realize that this was the ideal of the time. While his *Graces* seem to us far too abundant to be graceful, another generation may well discover their beauty.

Jordaens took up the exuberant vitality of Rubens, but having less contact with Italy, he tended to be more coarse. The warmer color scheme he uses goes very well with the boisterous good humor expressed in many of his works, though he can be both restrained and earnest in religious subjects. Van Dyck, who was actually the pupil of Rubens, had been to Italy. His technical ability is not inferior to his master, but in almost every other way he is a complete contrast. This becomes painfully evident in a Bacchanalian scene or even to some extent in his religious work. The conviction of the latter is missing, while all the vulgar exuberance has been removed from the former, leaving rather a dead result. However, he is redeemed by his portraits. He probably flattered his sitters, at least his royal sitters of the Court of Charles I. The effeminate but accurate drawing, the delicate gradations of light and shade, the splendid color derived from Titian, the superb texture of silks and satins create a beautiful though not a powerful portrait. Nevertheless, these qualities combine with a most refined taste to give that sparkling brilliance and aristocratic cast which was passed on to the later English school. Finally, we may just mention Teniers, the Flemish counterpart of the Dutch "little masters," and a direct descendant of the genre painting of Brueghel. His tavern or village scenes may sometimes retain the religious subject, but if so, this is a mere incident. It is the howling peasants, the village festival, the genre subject in short, which is the real theme of the painting.

DUTCH SCHOOL

The basic difference between Flemish and Dutch painting is to be sought in the history of the two countries. The southern portion mained Catholic under the rule of Spain. northern region, Holland, turned Protest and was successful in establishing its i pendence of the great Catholic power. The sult is the suppression of religious art. T meant that domestic genre should be couraged. In turn the taste of the burg patrons for accurate work coincided with subject in producing great technical skill. S life, textures, effects of light and shade h never been more accurately rendered. Such aim does not lead to thoughtful painting, rather to the idea of art for art's sake—a thing well done is good. It is, nevertheles filled with vigor, often chooses subjects fr humble life, and holds a high place as the mo prominent domestic art.

In earlier times, Dutch painting was close intertwined with Flemish, and hardly di tinguished from it before the seventeenth ce tury. Hals starts us in the middle of thing Like his associates in the school, his techniqu was superb, but unlike them, he attains a broa effect suggesting rather than defining; indica ing rather than drawing. His jovial dispos tion left its trace in the joyful aspect o his art. A glossary of the smile could be con piled from his works. In group portraits too, he was able to prevent an obviously pose appearance only too often found in suc works. His portraits belong in the very firs rank.

Rembrandt stands out from the rest of th school as Rubens does in the Flemish, or Ve lasquez in the Spanish. He transcends the school in reality, and so is not quite typical o it. For example, he is more thoughtful and imaginative. He is able to conceive on a higher plane than any other Dutchman. Moreover, he is rather less vulgar and more distinguished. His greatest contribution is his use of light. Here he is indirectly influenced by Caravaggio. Although his shadows are dark and the effect suggestive of studio lighting at times, he does not use black, and so avoids the unpleasantly dirty color of the Italian. The black is replaced by a golden light which softens and unites even the shadows. The darkest portions seem illuminated by reflected light. Had he not become so interested in light, he would probably have been among the world's greatest colorists. His delight in illumination, his success in representing textures and his superb technical skill led him to fame as an etcher. In the Dutch school he has no equal in the interpretation and treatment of biblical subjects and his etchings appealed to the poorer classes as well as to the rich.

More typical of Dutch art are the so-called "little masters" whose chosen field was genre painting, and who between them covered the social scale. Ostade is the lowest in the scale, painting with a coarse technique peasants in a tavern, brawling and dicing. Steen strikes a little higher, reaching the lower middle class. He is perfectly honest and straightforward with almost as jovial a temper as Hals, and with a willingness to take ideas wherever he can from the other "little masters." Terborch represents

FAMOUS PAINTINGS—II

1 Mrs. Siddons as "The Tragic Muse," by Reynolds. 2 The Forge of Vulcan, by Velasquez. 3 Lady Hamilton as "Daphne," by Romney. 4 Portrait of a Man, by Franz Hals. 5 The Light of the World, by Holman Hunt. 6 A Woman Reading, by Peter de Hoeck. 7 The Descent from the Cross, by Rubens. 8 Blue Boy, by Gainsborough. 9 Mona Lisa, by Leonardo da Vinci.

the aristocracy of Holland—that is, the well-to-do merchant class. These he paints at their music lessons or their social meetings, dressed in elegant silks, satins, and velvets whose textures delight us only a little less than they pleased the original patrons. The interior of Dutch houses was the chosen métier of de Hoogh, and in that small field, he is remarkably fine. The checkered pavements barred by alternate patches of light and shadow, the reflections, the maps on the walls, all are familiar to us, thanks to his paintings. Generally classed as one of the "little masters," but far superior to the rest, is Jan Vermeer of Delft. Perhaps no one ever carried the study of value and intensity relations quite so far. Each object retains its color as it blends with shadow. This leads in the direction of extreme realism, and had he nothing else to offer, he would hardly deserve as high a place. It is a sense of beauty far superior to the other men of this group that gives him his high position. Most of his figures are young women whom he treats with a reverence quite foreign to the spirit of the day. Ordinarily, women were regarded as conveniences, but Vermeer's point of view is more delicate and flattering. Added to this, his fine sense of composition by a series of rectangles, carefully balanced, and varied by just enough curved or oblique lines displayed a skill the other "little masters" never attained.

The last type of Dutch Art includes the various parts of landscape painting and its allied fields. This kind of subject was perhaps for the first time cultivated solely for its own sake. We find smiling views of Holland, dotted with windmills and striped with canals. Ruysdael touches on the more romantic, wilder forms of nature which he had seen in his trip to Scandinavia. Hobbema gives the more formal type, his *Middleharnais Avenue* having quite exact symmetry. With so much of their interest lying on the water, it was but natural that the Dutch should not forget views of the sea. Such a man as Willem van de Velde makes a specialty of this work. Moreover, landscapes with cattle were splendidly painted by Cuyp. Still life of flowers, fruit, game and so forth gave the painters an opportunity to display their technique. Many of these Dutch still lifes are among the finest in execution though not the most interesting of paintings.

FRENCH SCHOOL

French art is peculiar in having no single man to correspond with Rubens or Rembrandt. Genius is not at all lacking, but no one or two figures seem to dominate the school. Its development follows the same lines that may be seen in sculpture or architecture. So in the sixteenth century, the painting is largely medieval. It is in part an offshoot of the Flemish School, but the native elements are easily distinguishable. Indeed, French art has always a persistent national flavor. This is evident in a tendency to soften the extreme realism of the north, which had frequently led to ugly types being employed. The French sense of beauty could not permit this. A sprightliness and gaiety are also apparent. The portraiture of the Clouet brothers is distinctly court painting with a delicacy of drawing hardly to be surpassed. While not lacking in strong characterization, the delicacy, even the politeness, is never lost.

Contemporary, and slightly later than the subtle portraiture of the Clouets with its semi-Flemish character, Italian influence begins to creep in. This branch centered at Fontainbleau where a number of second rate Italians like Primaticcio and Il Rosso settled and established a decorative school of more merit than might have been expected. In spite of coming from the Michelangelesque traditions, the French influence helped them to leave works of some decorative merit, though inclined to be heavy in effect.

In the seventeenth century, two most celebrated French artists stood aside from the general tendency. Poussin spent much of his life in Italy where he was admired and felt at home. There he evolved his typical style, elaborate classic allegories or mythologies, shepherds in Arcadian landscapes and so on. The figures might have been inspired by Roman bas-reliefs. In proportions, they are correct; in feeling, cold; in subject, classic; but, as a whole, the effect is epic. His classical studies led him to subordinate color to form. His tones are frequently clashing, but the construction and solidity of the fabric of the painting is impeccable. Claude Lorrain also spent most of his life in Italy and became there a master of landscape. In accordance with his time, the scene is not realistic but classical, and is carefully arranged. Each fallen branch has been removed. The basis of the color is brown rather than green; brown shadows, brownish leaves, brown trunks and so on. Nevertheless, he is not without a romantic touch. For the first time the sun itself is introduced. Unreal the paintings may be, but they are filled with poetic sentiment for all that. Moreover, in his quick sketches, Claude shows himself a consummate draftsman. Unlabored and rapid is the technique, and the works are brimming over with suggestive beauty.

Official painting of the time seems less satisfactory to us today. The centralization of the government brought about regulation in the arts. Artists were expected to devote themselves to the glory of Louis XIV and to emphasize the dignity of the state. The king's deputy in painting was Le Brun who knew his duty perfectly. Enough of a courtier to get on well with Louis XIV, he worked huge canvases to decorate Versailles or the Louvre. His pompous style is not without good drawing, but the colors seem unpleasant to us. Sooty browns cover the bulk of the canvas, but these were admired at the time as testified by Molière. It is possible that the pigments have been transformed by time. His influence cannot be exaggerated as the founder of the Academy and also the French Academy of Rome, becoming indeed, the source of academic painting.

In portraiture, the seventeenth century starts with Philippe de Champaigne, whose northern blood, tempered by France, produced a direct and simple portrait style, sober with subdued colors, but dignified. Under Louis XIV, por-

traiture became pompous with the rest of the arts. It was not badly composed, but tended to flatter its subjects by rich robes and little character. Mignard, for example, the fashionable and aristocratic portrait painter, has become synonymous with over-delicate faces, tiresome insincerity, and pedantic handling. Largilliere and Rigaud belong to the same group.

The classicism, the heaviness, and the repression of the reign of Louis XIV provoked a reaction on the old monarch's death. This came with the greater vigor because Louis XIV lived so long. On his death, France broke into an orgy of gaiety. The Italian comedy which had been expelled, returned to renewed popularity. After the stilted life of the court of Louis XIV, society reverted to naturalism, at least in theory. The outdoor life was admired; picnics were frequent, and shepherds and shepherdesses were generally supposed to lead the ideal life. Actually the return to rural simplicity was hardly less affected than its predecessor. Courtiers could only play at being rustic, and their bucolic fetes were as sophisticated as the court functions of the preceding reign. Love, or at least flirtations, became the rule, mingling with the affected simplicity.

The interpreter of this movement par excellence, was Watteau. As painter of the Fetes Galantes, he gives us courtly parties held in the open. At such times, gaiety and frivolity were the rule. A playful, frolicsome spirit prevails with a touch of the risqué. One sees fine ladies playing at love. The whole is thoroughly affected, but none the less charming. As a draftsman, Watteau stands in the first rank. He knows instinctively where to place his emphasis, and his touch is as delicate as possible. Moreover, in contrast to the murky browns of Le Brun, Watteau's color is clear as crystal. For decorative art, we may mention Boucher whose panels are adapted to the ladies boudoirs where they were to be placed. Pinks and light blues predominate giving an effeminate note to the whole. The undulating lines, the reverse curves form the essence of the rococo style. The composition is good, and from a decorative point of view, the whole work is most successful. Sensuality there is, but never vulgarity. One may point out that such delicate sensuality is infinitely more appealing than the type we find in Ruben's and is, perhaps for that reason, more seductive. Fragonard lived beyond his time, and came to be looked down upon as a corrupter of public morals, but was a first rate painter for all that. His color is spread lightly with a broad brush stroke, and a swift, sure handling. He speaks the language of the flesh as do Correggio and Goya. Frequently Fragonard is indelicate and naughty, but never coarse. Painting of this sort may not have lofty aims, but it is more attractive to the taste of the present day than the more monumental art which preceded it.

Nevertheless, its very inconsequential character again provoked a revolt just as had the extravagant delicacy of rococo architecture. Such a man as Greuze condemns Fragonard and Boucher but is vastly inferior to either in every respect. He indulges in long morals in paint of the tritest, and least inspired variety. His sentiment in such works does not ring true any more than does the propriety of his pretty girls whose features are badly drawn and whose clothes frequently are so disarranged as to reveal their charms. The figure of Chardin stands apart from the current of the eighteenth century work. His quiet domestic scenes are akin to the Dutch genre painters. Without dramatic force, he renders still life as could none of his contemporaries. He painted domestic scenes with a purity and simplicity never equalled for refinement.

ENGLISH PAINTING

Painting in England before the eighteenth century is largely due to imported foreigners. Holbein, Mor, Rubens, and particularly Van Dyck were active there, and it is probably due to their influence that one finds the splendid aristocratic school of portrait painting being developed. Through Van Dyck, the fine color of the Venetians entered England and probably through him also the magnificent treatment of rich costumes. Along with his interest in portraiture, runs a strain akin in its aims to literature. Narrative painting, dealing with the clear and vivid rendering of a story, may be moral, sentimental, or satirical. The third branch of English art is landscape, but this field is barely started before the nineteenth century.

Hogarth is a good portraitist, doing solid straightforward work with little glamor, and few striking, sparkling points. His fame rests rather on the bitter series of paintings he produced which satirize the times. A biting satirist of contemporary life, one wonders how conditions could have been allowed to remain unchanged after *Marriage à la Mode*, or the *Rake's Progress*. His treatment is unlike that of Greuze in that where the latter is sentimental, Hogarth is caustic. His strength lies in his power of ridicule. Moreover, Hogarth's drawing, his composition, his technique, were of the very best.

Landscape, as we have said, barely started in the eighteenth century. Wilson, though not successful as a portraitist, turned to landscape, studying in Italy and being strongly influenced by Lorrain. His best Italian landscapes reach the plane of real distinction, but still more important was the vogue of water color fostered by keen amateur interest. At first, drawings were tinted very simply, but the palette was slowly expanded successfully. The subjects were naturally landscapes, perhaps enlivened by a ruin. The school of Norwich continued the movement. Of the many artists practising this landscape painting, Old Chrome is perhaps the best known, but Cotman, Girtin, and Prout continue the field in the nineteenth century.

Portraiture, however, remained the English strong point. Lely, though himself a Hollander, continues the traditions of Van Dyck as regards English art, but the great names were to come at the close of the eighteenth century. Reynolds shows us the distinguished work of the school. His subjects are aristocratic to the last degree, and keenly conscious of their ancestry. The technique, color, and placing on the canvas

suit the sitters. Although Reynolds is perhaps the most thoughtful of the school, even he does not burden our wits, but surely delights our eyes. Gainsborough is even more magnificent. Probably all these men flattered their sitters, but that innate consciousness of social superiority belongs to the subjects. For sheer beauty of color and handling, derived from the great Venetian painters of the Renaissance, one must look far to surpass such work. A galaxy of other portraitists of the same time such as Raeburn, Romney, and Lawrence were only less celebrated than the two mentioned.

NINETEENTH CENTURY EUROPEAN PAINTING

France has been the leader of Europe in artistic matters since the reign of Louis XIV. That position of eminence has been maintained to the present day, and since that is so, a knowledge of French painting is essential to the understanding of art elsewhere in Europe at this time. Two main threads may be discerned in the complex historical web of the time. The first to appear is the academic movement, starting with the classical revival, but gradually changing as one innovation after another was proved practicable by the opponents of the academy. This branch, backed by its official standing with the government, was the reactionary force opposing progress. The various revolts of the progressive factions may be grouped loosely under the term "romanticism." Strictly speaking, the Romantic revival in painting corresponds to that in architecture, and was at first primarily a change of subject, a desire to paint other than classic themes. Such a movement was stimulated by the stirring historic events of the period. Men's eyes were opened to the color of the Mediterranean lands by Napoleon's eastern campaign of 1798, the revolt of Greece, 1821–29, and the French acquisition of North Africa beginning about 1830, to mention only a few events. But the revolt in subject matter soon extended to include protests against affectation and lack of naturalism, making itself felt in the Barbizon school or in plein-airisme. This in turn led to discussion of technique, and the formulations of the theories of impressionism.

David is the unquestioned leader of the classic movement. The general lines of its theories had been propounded as far back as the reign of Louis XIV. Among its most important doctrines is the choice of subject matter which, they believed, must be noble, elevating to the mind and spirit. As generally interpreted, this meant subjects taken from classic history or mythology. Art must be public in character and avoid all things merely intimate or trivial. Dutch genre painting or the work of the Fetes Galantes were unsuited to representation. Most important was the idea that only "belle nature," the approved and codified aspects of nature could be satisfactory. The best instructors in what "belle nature" was, were the reliefs, statues, and so on of antiquity. Consequently drawing with a suppression of color became the keynote. It is hardly necessary to point out the fallacies in this doctrine, that color is essential to painting or that imitation of antiquity could hardly lead to originality or progress. Nevertheless, the dogma reigned supreme during the French Revolution and Empire. Men felt themselves inspired by the Romans of the Republic and David was the ideal man for his time. His works are well drawn, and carefully composed in an academic fashion, but with insignificant color, unconvincing poses, no atmosphere, and no warmth of feeling. Throughout they are correct but cold. Prud'hon was very different. He had almost the sensuality of a Correggio. His spirit is more of the Renaissance than of the classic revival where he is placed only by courtesy. Gros, as the successor of David in the academy, felt it necessary to attempt the classic subjects, but his best work was done in other lines.

Gericault, in the *Raft of the Medusa,* asserted his right to choose subjects which interested him wherever he might find them. The terrible and moving story is told with conviction, but, nevertheless, drew upon itself the anathemas of the academy. Delacroix is the real leader of the Romantics. He expressed his contempt for academic doctrine by asking what the Greeks did without antiques. His subjects were contemporary, exotic, or from the middle ages, and painted with a feeling, a vitality which was convincing. So, in *Liberty Leading the People,* the very spirit of revolution is embodied, and patriotism is heard through the din of the barricades. Moreover, he rebels against the technique of the academy, laying his emphasis on color rather than drawing. To him all nineteenth century painting reverts.

David and Delacroix were the leaders and founders of their respective schools. Ingres was one of the most subtle draftsmen of all time. Cold he is, but in spite of a suggestion of the colored drawing too often obvious in his work, the sheer beauty of the line and its harmonious use make ample compensation. His pencil sketches are among the subtlest portraits ever put on paper. Couture emphasizes manual dexterity and though fundamentally academic, shows how that organization adopted suggestions from its opponents. Bouguereau and Cabanel produced a series of nudes, always female, which won awards from the juries. Although faithfully drawn and painted, they have little claim to lasting fame. Gérôme carried his modification of academic notions to the point of representing genre and exotic subjects with photographic accuracy. The military painters like Detaille, Raffet, and above all, Meissonier do the same infinitesimal sort of work. It almost approaches miniature painting. Later members of the academy like Bonnat and Carolus-Duran resorted to portraiture in which field they achieved considerable success. The brutality of the former is the antithesis of the delicate and sensitive style of the latter who was the master of Sargent. They had some ability at characterization, and were not lacking in technical facility.

Honoré Daumier has more or less recently come to his own, though he was for a long time neglected. His art is like that of Hogarth in that it is satirical, carrying a bitter sting with it, but fundamentally is quite serious. He created the vocabulary of modern art by keeping to the barest essentials, finding his planes and blocking out his masses with simplicity and

bigness. His dramatic intensity is the result of an ability to extract the pith of a given scene. The decorative massing of the surface in the drawing, and on occasion the color, are superb.

The Barbizon school scorned all the awards of the academy, returning to nature and striving for modest, unobtrusive, unaffected simplicity. They did not shock nor attempt to force their way, and recognition came slowly. The greatest figure generally associated with the group is Millet, whose sympathy with the sturdy peasants allowed him to ennoble the type. Such a work as the *Sower* is a glorification of toil, and the figure is endowed with a powerful physique for the purpose. The grandeur of epic poetry is found in this type of the struggle of humanity for existence. Although he had the disregard of details and the creative power that most of the academy lacked, he was criticised by that group for careless work. Another figure in the school is Corot whose pearly landscapes again won but tardy recognition. His spirit is lyric as Millet's is epic. The delicate filmy trees half cloaked in mist are in fact surprisingly true to nature. He has avoided many of the earlier conventions—the dark enframing foreground, the brown shadows. He cultivates tone rather than color, and if his modesty and independence prevented pupils, his influence has been none the less. Rousseau, Daubigny, Diaz, and Troyon paint quiet landscapes or cattle pictures in which Dutch influence is prominent.

Courbet was not content without recognition, and proclaimed his realistic aims in no uncertain tones. His point of view is essentially matter of fact—a desire to paint what he sees and nothing else. Actually he modified nature or he would not be worth mentioning. His militant spirit provoked a battle royal with the academy. *The Burial at Ornans* drew a tirade of abuse as being unworthy in subject, though its strength is striking. In his landscapes of marine and forest scenes he is again noteworthy. Bastien-Lepage propounded the theory of plein-airisme, of painting out-of-doors which had been practised long before. Instead of more or less concentrated studio light, he preferred that diffused light of nature without marked shadows.

Impressionism rebelled against the minute treatment of a Meissonier, so Manet models solidly with color rather than light and shade. The emphasis is placed on the artistic sensation of momentary vision. Only so much as the eye can take in at a glance is painted. Details are left out or merely indicated as in Velasquez. He chooses any subject, and composition, drawing, and color occupy the attention of the artist. Manet shocked the public by powerful representations of well-known courtesans with marked characterizations, and his treatment of Renaissance subjects in modern dress. Manet realized that greater vibration of light and color could be obtained by placing unmixed pigments next to each other on the canvas and allowing the eye to complete the fusion. The greatest emphasis is placed on atmospheric effects. Renoir in the same way treats peculiarly French subjects with a French spirit full of sparkle and life. Also belonging to this group were Pissarro, Sisley, and Raffaeli. Degas deals with composition in a manner akin to the Japanese, creating the subtlest balance with lines of ballet girls or arrangements of race horses. His love of natural lighting links him with the impressionists as do the solid forms, and the interest is always rather in the treatment than the subject. Moreover his color is magnificently clear.

The mural painting of Puvis de Chavannes stands apart from the movements of his time. Realizing that most of the recent attempts in this field had failed because they attempted to be too naturalistic and violated the flatness of the wall, he deliberately kept his quiet scenes unnaturalistic by using light color of low intensity and but little modelling. The broad symbolism was enough to stimulate thought, but at the same time was easily comprehensible. Archaisms are purposely introduced so that the result is one of great decorative value.

England continues her branches of narrative and portrait painting, but to these adds a third, landscape, which had started in the latter half of the eighteenth century, in the water-colorists. Constable combines truth of representation and the finest selective quality. He throws over the brown classic shadows, the conventional dark foreground, turning instead to the greens of nature, and this before the beginning of the Barbizon School in France. Indeed he influenced them, especially through the English exhibition in Paris in 1824. Furthermore, by composing his greens of several values, he foretells the advances of the broken color impressionism of Monet. Turner too, is a naturalist at heart, though toward the end of his life, he leans toward atmospheric effects in which interest in brilliant color is predominant. Moreover, Turner was more than merely a good draftsman, he was a splendid composer as may be seen in many of the plates of the Liber Studiorum series in which he tried to rival the works of Claude Lorrain.

The literary strain in English painting is illustrated by the Pre-Raphaelite group. Led by Rossetti, these men attempted to return to the ideals and the unaffected spirit of the fifteenth century Italians whose mannerisms they got, but whose truly beautiful and ingenuous quality escaped them. Burne Jones' attenuated forms do not lack rhythm or decorative value, but have an effeminacy which weakens them. His figures look like aesthetes. Hunt at Keble College, Oxford, exhibits the depths of overstrained sentimentality. Although his ideas were decided, he was strongly influenced by literary motives, and his work is distressingly affected. Other members of groups like Brown or Millais turned from it to straight narrative painting with no pretense or apology. While not a member of the Pre-Raphaelite brotherhood, Watts had a similar spirit. He is stronger, with far more sense of bigness, frequently employing symbolism, with at times a good sense of form and color, but a technique which did not always respond to the opportunity.

The barest mention of other European painting must suffice. Germany continues to exhibit strength and truth without grace or lightness, nor has she lost originality, though Overbeck and the Nazarenes attempted much the same thing as the Pre-Raphaelites in England. The extreme of realism with hard modelling but fine

lines comes in Leibl. Böcklin shows a fantastic imagination in his weird lyric pictures. Or Liebermann gives us the stirring energy expressing itself in creative joy, but always kept in hand by his admiration for Degas' refined taste. The Russian, Vereshchagin, himself with a martial education, produced a series of much discussed works whose didactic purpose was the propaganda against war by representing the horrors of war. In Scandinavia, Zorn deals with the crystal clear, but cold, northern sunlight. His etchings glow with sparkling contrasts and technique, and are filled with spontaneity. The Spanish counterpart of Zorn is Sorolla in whom the glaring brilliant light of his country found an exponent. At times, as in the Hispanic Society in New York, he attains considerable decorative value. However, Zuloaga is one of the strongest of the painters of today. His attennuated maidens, decked with mantillas and lace, with combs in their hair, stand out from backgrounds of rich rolling smoke, which, though natural to Spain, have some of the weird and mystic suggestion of El Greco, while the characterization of these seductively rouged and powdered beauties has some of the acidity of Goya.

MODERN PAINTING

Paul Cezanne (1839–1906) was the point of departure for the whole modern movement, and also its chief cornerstone. He was contemporary with the Impressionists (Monet, Sisley, Pissarro, etc.) but with an aim quite different from theirs. While they insisted on the importance of rendering atmospheric effects, he aimed to make impressionism over into classical mould—(post-impressionism). He concentrated on the representation of solid form and the interpretation of the forces which created the forms, and tried to express them by the use of the many-hued palette of the Impressionists. Painting was to Cezanne a painful process, but his color perceptions were unusually keen, and his feeling for the interrelation of form revolutionary. Without exaggeration he may be said to have influenced contemporary art more deeply than any modern painter. Paul Gauguin (1851–1903) began as an imitator of Cezanne but eventually carved out a personal and highly decorative style after living the life of a native in Tahiti and the Marquesas Islands. His deep rich vibrant color brings to one's mind the qualities of the thirteenth century stained glass. Van Gogh (1853–1890), a Dutchman, painted crude but extremely powerful portraits, landscapes, and still-lifes in brilliant color. He died insane at the age of 37. Paul Signac (1883–) attempted to reduce the Impressionist theory to a science, and applied pure pigment in regularly placed patches, using only the primary and secondary colors. His close follower and pupil was Henri Edmund Cros. Georges Seurat (1859–1891) also employed the principle of the division of tones, but applied the color in minute points. His method came to be known as "Pointillisme." Seurat's talent was of a high order and his unusual compositions are much sought after today.

The year 1904 is the most important date in the story of modern art. A group of young painters, later called "les fauves" (the wild beasts) rallied around Cezanne's standard and declared an artistic revolution. To illustrate his theories Cezanne had remarked that all Nature could be reduced to the cylinder, the cone and the cube. Younger artists took this figure of speech literally, and reduced Nature's forms to geometrical abstractions. In 1907–08 Georges Braque and Pablo Picasso exhibited experimental pictures in this manner, which were dubbed Cubism. Henri Matisse, a great colorist, began to exhibit about this time. He is an individualist, with a fine feeling for decorative color. He and Picasso are today ranked as the leading modernists.

From this time on, modern art split into three fairly distinct branches: (1) Abstraction (Cubists); (2) pure emotion (Expressionists, largely German); (3) Primitivism (Henri Rousseau and others who have returned to the Italian primitives, Negro sculpture, and the drawings of children, etc., for their inspiration). There are many emanations from these tendencies. Futurism was a short-lived attempt to overcome the static qualities of Cubism by trying to add the time element and represent movement or successive phases of an event (Gino Severini, Manuel Manolo, Carlo Carra, Giacomo Balla, etc.) Synchronism was an effort to reduce to a science Cezanne's evocation of form with color (Macdonald Wright, Morgan Russell). A kind of Futurism sprang up in England called Vorticism (Wyndham Lewis). Dadaism, with Tristan Tzara as its interpretor, was the reductio ad absurdum of the modern movements. There are many individuals whose names have not been mentioned here, but who have exerted considerable influence and achieved a certain amount of success. (Amadeo Modigliani, Oskar Kokoschka, Pierre Bonnard, Marie Laurencin, Jean Marchand, Karl Hofer, Maurice de Vlaminck). Andre Derain, Marc Chagall, Duncan Grant, Othon Friesz, Albert Gleizes, Andre L'hote and others have gone through the school of Cezanne and Cubism but have now developed individual styles. Fernand Leger, Jean Metzinger and, occasionally, Picasso still practice cubism in various forms.

In general the tendency has been to break with the traditions of the past, and try through experimentation, to make the art of painting more flexible and expressive; this is often done at the sacrifice of subject matter and the illustrative appeal. At the present time modern art is at the cross-roads. Simplification and distortion have had a salutary effect on painting, but no one can tell in what direction it will develop. In the final analysis it will be individual genius, not theory, that will develop something sound and enduring out of the lessons the "isms" have taught.

AMERICAN PAINTING

Even more than the other arts, this country has been inspired by Europe in painting. At first toward the close of the eighteenth century, a branch of the English portrait school arose. The men got their training by experimenting with portraits of their kin and then going out to paint coaches, signs, and likenesses. The latter were naturally pretty crude, and the effect as

wooden as the signs. Some of the better men managed to get abroad, but even their style shows a marked provinciality. Smibert, one of the earliest, is represented by the portrait group of Bishop Berkeley's family. Although in bad condition, with dirty color and stiff figures, the drawing is passable. Copley was a far better artist in every way. He is not lacking in the attributes of the English portrait school, but his figures have a certain unpolished character which betrays them as colonial. The gentlemen and ladies belong to the aristocracy of New England, a class which is dressed in fine clothes, but has not entirely lost their homely square-toed nature or become at home in such raiment. They are honest and dignified, not in the least lacking in the nobler attributes of mankind, but unaccustomed to the elegance and refinement produced in the English aristocracy by many generations of social prestige. His truthful work indicates the dignity and self-reliance of the sitters. Just before the outbreak of the revolution, he left this country to settle in London where he continued to prosper. West was an exact contemporary of Copley, but spent almost his entire life in England where he became President of the Royal Academy in 1792. His color is none too good, and the figures, although well placed, have but little character or life. His series of huge religious canvases were greatly admired, but quite unsaleable. They seem to most people at present to have few virtues, and many faults, to lack style, beauty of workmanship, sincerity, and conviction, and to be brimming with obvious moralizing. In battle scenes, he made the innovation of using contemporary costume with much success. His success depended on his genial, gentlemanly temper, his appreciation of patronage, and consequently his ability to retain it—notably the royal favor of George III until that monarch lost his mind. It was fortunate for Americans that West was of this type, for he was ever a friend and assistant of struggling American painters in London, and for generations hardly a man was without his influence.

Peale is the best known of the portraitists from 1774, the year in which Copley left this country to Stuart's return in 1793, but although he improved toward the end of his life, his figures were stiff and the tones raw. Stuart in many respects must be awarded the palm in colonial painting. He was a pupil of West, but very different in character, and ability. He had far more of what is known as the artistic temperament, lacked much of the geniality of West, and had more violent likes and dislikes. Almost all his works are heads which are placed only slightly above the center of the canvas with enough body below to satisfy the laymen, but it is the head alone about which he thinks. This is treated with splendid characterization, fine drawing, and pearly, bright color which, thanks to being put on thinly with a very sure hand, and not worked over at all, retains its pristine freshness and clarity. Many portraits of Washington are attributed to him, but of these only the Gibbs-Channing and the Athenaeum portraits seem to have been done from life. Several copies of the former by Stuart himself are known. Trumbull has some of Stuart's brilliance, but as a rule is not his equal. However, his historical subjects of early American events are filled with valuable portraits. Allston admired West extravagantly, imitating him in the large moral or religious canvases which were readily understood, and even praised at the time, but seem extremely tiresome at present. Other men of the period of English training include Malbone, Vanderlyn, Morse, Leslie, and finally Sully who has some fine works, but tends to mere prettiness, occupying much the same relation to Stuart that Lawrence did to Reynolds.

As the English school itself waned in ability, its influence on America decreased. Instead painters went to schools on the continent such as that at Düsseldorf in Germany. This school gave a firm foundation of accurate drawing and the composition was not bad, but the color was none too good, and the spirit generally affected. Leutze's *Washington Crossing the Delaware* illustrates the virtues and the ridiculous aspect of its shortcomings. Nevertheless, the painting is an often reproduced symbol of American patriotism and may be seen in thousands of public schools about the country.

Landscape painting had been practised from the first, but the native strain first makes its appearance in this genre. Durand and Cole were the important precursors, the latter producing some fairly accurate landscapes in his smaller and better works. Durand was a good craftsman, and showed perfect sincerity in his silver gray landscapes, with the color of the shadows truthfully rendered. He probably painted in the open. His weakest point is composition. From these men sprang the Hudson River school. Kensett followed the realistic aims of Durand with greater facility. Church also is facile, composing his work fairly well, but emphasizing the importance of nobility of subject. Bierstadt, trained at Düsseldorf, like several others of the group, attained a standardized level of uninspired excellence, working without conviction. The culmination of early landscape painting is to be found in Innes who wished to produce the "impression a scene has made upon him." At first, he continued the minute technique of the early members of the school, but he gradually attained richer tones and broader handling. His later works hold together harmoniously. Although he was less popular than other men of the time, his fame has increased recently. Wyant is less varied, preferring sunny rolling country seen between tree trunks and rendered with a sure handling and harmonious style. Martin started like Kensett but under the influence of the Barbizon school, he simplified his drawing, and loosened his style while still retaining a melancholy feeling.

Just as in architecture, the new names of the generation after the civil war had been trained in Paris. The heavy correctness of Düsseldorf seemed dull before the brilliance of Paris. All along some, perhaps even most, of the men had studied in France, but now the influence becomes more pronounced. Vedder has perhaps rather more of the classical Italian, but Hunt shows a broad technique, good color and form in large masses. La Farge was at his best in mural painting where his desire for large size could be

satisfied. Whistler was an American spending his life in England. Eccentric in his manners, his work aroused a storm of criticism which probably delighted him. Especially in his later work, he loves extremely subtle harmonies of color which he designated by musical terms. Influences from France, Spain, and Japan combine in his work, but are not always properly fused. From the latter, he takes the extremely subtle compositions whose balance is carefully adjusted by the relation of details as in the portrait of his Mother. Indeed, this subtlety is apparent in whatever he does. Taste, in him, predominates over strength. In etching, he must rank with Rembrandt and Seymour Haden.

Homer proudly boasted that he had never studied abroad. This fact accounts in large measure both for his strength and his weakness. His work has a strong native flavor due to the direct vision which makes his works more telling than reality. He has an elemental vigor which compensates for a lack of quality. He feels weight and force exactly; his brush work is firm and crisp, producing fine values, but occasionally harsh color. Another painter, similar in a lack of foreign training and an intensely realistic point of view, though of much later date, is Bellows, whose lithographs are the strongest American work in this medium.

Among the more recent painters, we find the foreign training at an earlier age. The older masters had at least partially formed their styles before they went abroad, and maintained some trace of this early training. The more recent men get their foreign training first and then overlay on that foundation whatever of national characteristics they acquire. Duveneck's work is facile and brilliant. His sculptured tomb of his wife is one of his most inspired productions. Painter, sculptor, and etcher, he is one of the most versatile artists America has produced. Chase stands halfway between Whistler and Sargent, in his subtlety, and his purely painter's delight in technique. Others show the influence of French impressionism, proving that the younger Americans were awake to the new developments in France, and were sympathetic to them. Weir is one of the most vigorous of the group. Twachtman has a sensitive eye for delicate nuances of color. Hassam is a typical advocate of broken color impressionism with its fine color effects. Broader than Hassam, and stronger than Harrison, Frank Benson has done fine, direct work in paint and etching.

Sargent, trained by Carolus-Duran, attained a brilliance of technique which at first carried all before it. His extreme facility with the brush sometimes produced a feeling of brittleness, but was most fortunately combined with an analytical and clear perception of character, as in the vivid portraits of the Wertheimer family. His decorations of the Boston Public Library were finely conceived, and executed with a monumental effect to produce a decorative whole of great originality. His early work promised much, but his later painting in general failed to live up to this high standard. His rapid, direct technique in watercolor produced some of his best work. Abbey also is represented in the Boston Public Library by a series of murals with much less successful results because the plane of the wall is not sufficiently regarded, and the pictorial element is overstressed. Mary Cassatt of the same generation, deliberately shunned the prettiness of popular art, preferring spots of local color without much light and shade. Thayer prefers to idealize and to ennoble his subjects. Brush sought fine craftsmanship and sympathetic character which he found especially in his wife and child. Cox shows his Parisian training frequently by an overemphasis of technique in a use of the nude, being primarily an academic painter. For the rest, the fine landscapes of Tryon, the portraits of Cecilia Beaux, and F. W. Alexander; Remington's interpretations of frontier life; the dash of Lie; the drawings of Bridgman; the illustrations of Gibson, Pyle, Parrish, and Sterner may be mentioned in passing.

Still more recently, the expressionist movements in Europe have found faint echoes on this side of the ocean. Luks, like the rest, pours contempt on all academic training. His own work is characterized by heaviness in color. Gauguin's profound color is reflected in the work of Blumenschein who is associated with the School of Taos. Artistic elemental force characterizes Kent at his best, although unforgiveable weaknesses creep in due to his being too prolific. Decidedly less modernistic in tendency was Davies who was very much influenced by the spirit of different styles. Among the most promising members of the younger school, we may mention Kroll and Halpert, the latter a follower of Cezanne and Derain. Robert Henri was a painter of ability whose influence on American art will be felt for many years. For sound craftsmanship, Hawthorne is difficult to surpass. In subtle qualities of light and color Carlsen is noteworthy. Waugh leads in the understanding of structure of the ocean in his marine subjects.

It is perhaps inevitable that this country should be strongly influenced by the older culture of Europe. At any rate, from the early Colonial times to the present, foreign affiliations, more or less modified, have been the rule and the native elements, while generally present, are kept somewhat subordinate. Nevertheless, this fact does not necessarily mean that American work is inferior to European. Some painters and some paintings have been produced which may properly rank with the corresponding European work. This country will produce a great native development sometime in the future, but not until the general level of taste, among the laymen especially, has been elevated to proper appreciation and until sufficient interest develops in the Fine Arts to support such work.

SCHOOLS OF PAINTING

Painters who are controlled by the same ideals, methods, or principles in their work are classed together into a school or group, without regard to the times in which they worked. There is one use of the word wherein it signifies all the painters of one country, distinguished from all painters of other countries. Also one master may influence several painters, and his followers are grouped into a school. Sometimes a nar-

rower sense is implied by the application of the term to the painters of a city. So we may speak of the "Italian School," the "School of Raphael," or the "Florentine School."

BRITISH SCHOOL. In Great Britain in the eighteenth and nineteenth centuries. Leaders were Hogarth, Sir Joshua Reynolds, Gainsborough, Raeburn, Romney, Lawrence, Wilson, Chrome, Constable, Turner, Millais, Burne-Jones, and Watts.

AMERICAN SCHOOL. In the United States in the late eighteenth and nineteenth centuries. Leaders were Copley, Stuart, Trumbull, West, Church, Bierstadt, Wyant, Martin, Inness, Whistler, Winslow Homer, Duveneck, Chase, Hassam, Abbey, Sargent, Kent, Henri, and Hawthorne.

BOLOGNESE SCHOOL. At Bologna, in Italy, in the sixteenth and seventeenth centuries. Leaders were the three Caracci—Lodovico, Agostino, and Annibale—Domenichino, Guido Reni, and Guercino.

DUTCH SCHOOL. In Holland, in the seventeenth century. Leaders were Hals, Rembrandt, Vermeer, de Hoogh, Ruysdael, Hobbema, Van de Velde, and Cuyp.

FLEMISH SCHOOL. In Flanders, in the fifteenth, sixteenth and seventeenth centuries. Leaders were the Van Eycks, Van der Weyden, Van der Goes, Memling, Patinir, Brueghel, the Metsys, Rubens, Jordaens, and Van Dyck.

FLORENTINE SCHOOL. At Florence, Italy, from the thirteenth to the sixteenth centuries. Leaders were Cimabue, Giotto, Orcagna, Masaccio, Fra Angelico, Botticelli, Fra Filippo Lippi, Ghirlandaio, the Pollaiuoli, Leonardo da Vinci, Andrea del Sarto, Fra Bartolommeo, and Michelangelo.

FRENCH SCHOOL. In France after the fifteenth century. Leaders were the Clouets, Poussin, Claude Lorrain, Philippe de Champaigne, Mignard, Le Brun, Largillière, Rigaud, Watteau, Lancret, Pater, Nattier, Chardin, Boucher, Fragonard, David, Prud'hon, Ingres, Géricault, Delacroix, Corot, Rousseau, Millet, Daumier, Courbet, Puvis de Chavannes, Manet, Degas, Monet, Cézanne, Renoir, Gauguin, Seurat, Matisse, and Derain.

GERMAN SCHOOL. In Germany after the fourteenth century. Leaders were Wilhelm of Cologne (1358–1372, active), Schongauer, Dürer, the Cranachs, the Holbeins, Cornelius, Overbeck, Leibl, Boeklin, and Liebermann.

NEAPOLITAN SCHOOL. At Naples, Italy, in the sixteenth and seventeenth centuries. Leaders were Caravaggio, Salvator Rosa, and Giordano.

NORTH ITALIAN SCHOOLS. A group of schools with more or less similar characteristics in the north of Italy at Parma, Milan, Padua, and so on. Leaders were Altichiero, Pisanello Squarcione, Mantegna, Cossa, Costa, Cosimo Tura, Francia, Foppa, Luini, Solario, Ambrogio da Predis, Moretto da Breseia, Moroni, and Correggio.

SIENESE SCHOOL. In Siena, Italy, in the fourteenth and fifteenth centuries. Leaders were Ducco, Simone Martini, Lippo Memmi, the Lorenzetti, Bartolo di Fredi, Matteo and Benevenuto di Giovanni, Taddeo di Bartolo, Vanni, Vecchietta, Sassetta, and Francesco di Giorgio.

SPANISH SCHOOL. In Spain after the fourteenth century. Leaders were Vermejo, Jaume Huguet, Dalmau, Ribera, Zurbaran, El Greco, Velasquez, Murillo, Goya, Zuloaga, and Sorolla.

UMBRIAN SCHOOL. In the province of Umbria in Italy, in the fourteenth, fifteenth, and sixteenth centuries. Leaders were Gentile da Fabriano, Piero della Francesco, Melozzo da Forli, Signorelli, Fiorenzo di Lorenzo, Antoniazzo Romano, Perugino, Pinturicchio, Raphael, Lo Spagna, and Pierino del Vaga.

VENETIAN SCHOOL. In Venice, Italy, in the fifteenth to the eighteenth centuries. Leaders were the Vivarini, the Bellini, Antonello da Messina, Crivelli, Carpaccio, Giorgione, Titian, Lorenzo Lotto, Palma Vecchio, Tintoretto, Veronese, Sebastiano del Piombo, Canaletto, Longhi, and Tiepolo.

FAMOUS WORKS OF ART

ABRAHAM, SACRIFICE OF. The event described in *Genesis XXII* was the subject of the competition panel for the bronze North doors of the Baptistry of Florence, won by Lorenzo Ghiberti in 1401, now in the Bargello in Florence. His panel shows more elegance and subtler composition than that of Brunelleschi which is also preserved. In paint, the most famous example is by Rembrandt, now in the Hermitage Gallery at Leningrad. Murillo, Raphael, Andrea del Sarto, and Teniers have also treated the subject.

ADAM AND EVE. A relief on the façade or S. Petronio at Bologna by Jacopo della Quercia. The powerful nude figures later had a profound influence on Michelangelo. The theme has been handled by Bandinelli in marble and by many artists, such as Masolino and Jan Van Eyck in paint.

ADAMS MEMORIAL. By Saint-Gaudens, in Rock Creek Cemetery at Washington. It is frequently called *Grief, Death,* or *The Peace of God.* A mysterious bronze figure of a woman leaning against a slab of polished granite.

ADORATION OF THE LAMB. Painted by Hubert and Jan Van Eyck for Jodoc Vyt in 1432. Its many panels include treatments of Christ, the Virgin, St. John the Baptist, Singing Angels, Musical Angels and Adam and Eve, while the central theme shows the Lamb of God on an altar in a beautiful countryside approached by all classes of men. From the altar flows the crystal clear stream of life. This central panel was probably inspired by the Paradise pictures of the school of Cologne.

ADORATION OF THE MAGI. Worship and the presentation by the wise men of the east of mystic gifts of gold, frankincense and myrrh to the child Jesus. A favorite subject of painters. The most famous are by Botticelli, in the Uffizi, Florence; Albrecht Dürer, in the Uffizi, Florence; Gentile da Fabriano, in the Florence Academy; Raphael, in the Berlin Museum; Rembrandt, at Buckingham Palace; Rubens, in the Antwerp Museum, Brussels Museum, the Hermitage, and the Louvre; Titian, in the Madrid Museum; Velasquez, at Madrid; Veronese, at the Brera of Milan, Dresden Museum, National Gallery of London, and Vienna Museum; and Leonardo da Vinci, at the Uffizi, Florence.

AEGINETAN MARBLES. The remains of the two pediments of the temple of Aphaia at Aegina were found by Cockerell in 1811, restored by Thorvaldsen; and are now in the Glyptothek at Munich. The subjects represent scenes from the Persian Wars. In all probability, they were influenced by Onatas, the head of the school of Aegina, and were sculptured about 480 B. C. They are the best examples of Doric sculpture up to that time, showing an interest in the nude male figure. The bodies are well expressed, but the heads for the most part show marked traces of archaism. They were bought by Crown Prince, later King, Ludwig of Bavaria for $30,000.

AESOP. The famous writer of fables appears in a canvas by Velasquez now in the Prado at Madrid. His physical ugliness according to the tradition has not prevented the painter from creating a masterpiece. The head especially illustrates Velasquez' dexterity with the brush, and sympathy with the subject.

AGE OF INNOCENCE. Painted by Sir Joshua Reynolds; now in the National Gallery at London. It representes a little girl seated under trees upon the grass.

AGIAS. Although the evidence is involved, it seems quite clear that this marble in the museum at Delphi is a very close reflection, at least, of the style of Lysippus. It may be an earlier work than the Apoxymenos, but it certainly is better, lacking the dryness of that figure. It is light and graceful, and may have been influenced by Scopas. Too, it shows more naturalism, which Lysippus is known to have sought for, than does the Apoxyomenos.

ALBIZZI, GIOVANNA DEGLI, and THE GRACES. Fresco, once in the Villa at Careggi, and now in the Louvre. This and its companion piece, representing Lorenzo Tornabuoni received by the Liberal Arts, were painted about 1487 by Sandro Botticelli to celebrate the marriage of these two scions of the Florentine nobility. In the former, a delicate compliment is paid the lady by placing her alone in one half of the picture, balancing the grouped Graces in the other half, and indicating her equality with and her possession of them all.

ALEXANDER AND THE FAMILY OF DARIUS. The great conqueror being presented to that royal family was the subject chosen by Paolo Veronese for one of his greatest masterpieces of composition. His monumental architecture and the subtle variation of interest on the part of the characters are well balanced. It is in the National Gallery in London.

ALEXANDER, HISTORY OF. A series of five paintings by Charles Le Brun; now in the Louvre. The subjects are *The Passage of the Granicus, Battle of Arbela, Tent of Darius, Alexander and Porus,* and *Alexander Entering Babylon.*

ALEXANDER SARCOPHAGUS. One of the richest of the sculptured sarcophagi found at Sidon, and now in the Ottoman Museum at Constantinople, belonged to a friend of the great general. Friezes of a battle and a lion hunt appear on either side of this sarcaphagus. One of the figures represents Alexander himself. The action of the reliefs is violent and the composition compact, but somewhat crowded. Most remarkable is the fine color which is preserved and which proves that paint, when properly used, can augment the effect of sculpture.

ALMA MATER. A statue by French; in the approach to the Library of Columbia University in New York. A colossal figure seated in a curule chair, with elbows resting upon the arms, her head crowned by a wreath, and bearing a mace upright in her right hand.

AMAZONS, BATTLE OF THE GREEKS AND. A favorite theme for representation on the friezes of Greek temples. It occurs at the temple of Apollo Epicurius at Bassae and in the Mausoleum at Halicarnassus. The painting by Rubens, now in the Munich Gallery, represents the conquest of the Amazons by Theseus, who is shown upon a prancing horse, and about to hurl his javelin at the Amazons, many of whom are falling from the bridge or struggling in the water.

AMAZONS. At least three distinct types may be recognized—the Berlin, Capitoline, and Mattei types. The first of these may be derived from Polyclitus. According to tradition, Phidias, Polyclitus, Cresilas, and Phradmon held a competition in this subject, thereby starting four types, but if the legend is indeed true, it is difficult to attribute the two non-Plyclitan types to any of the other three sculptors with any degree of likelihood.

AMOR CARITAS. By Saint-Gaudens; in the Luxembourg Gallery in Paris. One of the most admirable angel forms known to modern art.

ANATOMY LESSON. A masterly composition by Rembrandt, now in the Royal Museum, The Hague. This painting shows the marvelous handling of light and shadow and the clear portrayal of character on every face, the whole being bathed in the luminous atmosphere so characteristic of Rembrandt's genius.

ANGELUS. A celebrated painting by the French genre and landscape painter Millet (Paris, 1859). A peasant youth and maid pause from their outdoor work at the sound of the angelus, and stand in an attitude of silent prayer. This picture was purchased by the American Art Association in 1889 for 580,650 francs and resold in 1890 to M. Chauchard for $150,000.

ANNUNCIATION, THE. The announcement by the angel Gabriel to the Virgin Mary of the coming birth of Christ. A favorite subject of painters. Among the most famous are those by Fra Angelico, in San Marco, Florence; Fra Bartolommeo, in the Louvre; Murillo, in the Madrid and the Seville Museums; Ludovico Carracci, in the Louvre; Simone Martini in the Uffizi Gallery in Florence; Andrea del Sarto, in the Pitti Palace, Florence; and Titian in the Scuola di San Rocco at Venice. One of a series of paintings from the life of Christ by Tintoretto (1518–1594), and now in the Berlin Gallery. It was painted for the Guild of San Rocco, Venice, which commissioned him to paint three pictures a year at the salary of 100 ducats.

ANTINOUS. The illustration shows the marble bust of Antinous in the Vatican Museum, Rome. This is only one of several busts and statues of Hadrian's

dramatic effect. They are in the Jardin Richelieu at Calais.

BURIAL AT ORNANS. A large canvas by Courbet representing a peasant funeral. The mourners stand in a row beside the open grave. Although well composed and painted, the subject was condemned unmercifully at the time as being unworthy of representation by an artist.

BURIAL OF COUNT ORGAZ. Perhaps El Greco's masterpiece in Santo Tome at Toledo. S. Stephen and S. Augustine miraculously appeared from Heaven to honor the funeral of this just man. In the lower part of the painting, a series of fine portraits of the Spanish aristocracy provides at once a setting for the scene, and a contrast with the supernatural upper part of the painting showing the Heavens opened and filled with celestial beings.

CALFBEARER. Marble figure of a man carrying a bull calf over his shoulders, in the Acropolis Museum in Athens. The animal is more natural than the man. It is a work of the early archaic school of Athens in the first half of the sixth century B. C. A thin garment clings to the figure, and, since it is hardly more than engraved on the surface of the stone, it seems probable that it was emphasized by paint originally. The short beard is indicated by a number of spiral curls. It was the prototype of the Good Shepherd in Christian art.

CARITAS. In the Boston Museum of Fine Arts by Abbott Thayer. It shows an allegorical female figure standing erect with arms outstretched as though protecting two nude infants at her feet.

CARLYLE, PORTRAIT OF. The arrangement of this picture is very similar to the Artist's Mother, with the seated figure as a silhouette in profile, and with a subtle balance created by incidental pictures on the wall behind. Its subdued harmony and the exquisite nature of the composition are typical of Whistler. It is now in the art gallery in Glasgow.

CARMENCITA. Painted by Sargent, and now in the Luxembourg. The piquant attractiveness of the famous Spanish dancer has been rendered with the utmost skill. The artist was noted for his facility in handling paint, seldom better illustrated than in this canvas.

CARNATION, LILY, LILY, ROSE. In the National Gallery in London by Sargent. One of his most famous works, the flowers from which the painting takes its name are seen together with a child. The finely suggestive brush strokes typical of the master are most effective.

CASTOR AND POLLUX. Painted by Rubens; now in the Munich Gallery. The twins are carrying off Hilaira and Phoebe, daughters of Leucippus and priestesses of Athena and Artemis. The maidens were betrothed to Idas and Lynceus. This led to the war in which Castor was slain by Idas.

CAVALIER OF THE TIME OF LOUIS XIII. The minute accuracy of Meissonier's work is evident in this painting in the Wallace Collection in London. Not only is the costume correct from an archaeological standpoint even to the smallest detail, but all the minutiae have been microscopically drawn and rendered. The texture of the cloth is not suggested, but each thread composing it is painted.

CECILIA, ST. Painted by Raphael; now in the Bologna Gallery. The saint is standing between Saints Paul and John on one side and Saint Augustine and Mary Magdalen on the other. Domenichino, Rubens, and Reynolds have also treated this subject.

CHANCELLOR JOHN WATTS. Statue by Bissell; in Trinity churchyard in New York. The best work by this sculptor.

CHAPEAU DE PAILLIE. Painted by Rubens; now in the National Gallery in London. A half-length portrait of a young lady in a black velvet bodice with crimson sleeves and wearing a black hat with black and white feathers.

CHAPIN, STATUE OF DEACON. By Saint-Gaudens; in Springfield, Mass. The old Puritan, on his way to, or from, the meeting house, "grasping," as Kenyon Cox says, "his Bible as Moses clasped the the tables of the law and holding his peaceful walking stick with as firm a grip as the handle of a sword."

CHARIOTEER. This finely preserved Greek bronze from Delphi must have formed part of a chariot group originally. The figure is standing quietly, holding the reins in his outstretched hand. A realistic aim is apparent in the rendering of the folds of the light garment, and in the enamelled eyes which give a startlingly lifelike expression to the statue. Although its author is not definitely known, it may perhaps be by the Athenian sculptor Calamis, between 480 and 450 B. C.

CHARLES I. Painted by Van Dyck about 1635; now in the Louvre. The king is dressed in a white satin jacket, red hose, buff boots, and has just dismounted from his horse.

CHARLES V. AT MUHLBERG. Painted by Titian in 1548; now in the Madrid Museum. The emperor is mounted and carries a spear upon the field of Muhlberg, where he defeated the elector of Saxony in 1547.

CHILDREN OF CHARLES I. Painted by Van Dyck in 1638; now in Windsor Castle. Prince Charles is standing with his hand upon the head of a very large dog; Princess Elizabeth and Princess Mary are on his right; while Princess Anne holds James, Duke of York, upon her knee. A later picture by Van Dyck is also at Windsor, and an earlier one is in the Turin Gallery.

CHILDREN OF THE SHELL, THE. Christ and the Infant St. John are represented with a lamb and a shell by Murillo in a painting in the Prado at Madrid. The softness and sentimentality are irritating to the taste of the present day.

CHRIST CROWNED WITH THORNS. Painted by Titian in 1553; now in the Louvre. Another by Caravaggio is in the Hermitage; one by Ludovico Carracci is in Bologna; one by Van Dyck is in the Berlin Museum; one by Guercino is at Munich, and a second by Titian is also in Munich.

CHRIST DELIVERING THE KEYS TO ST. PETER. Painted by Perugino about 1481 in the Sistine Chapel at the Vatican. In the center, flanked by the apostles, Christ presents the Keys of Heaven to the kneeling St. Peter. The scene is a fine example of the space composition of the Umbrian School.

CHRIST ENTHRONED. A common subject of mosaics in Early Christian churches. The semidome of the apse was generally the place for this subject. Christ is flanked by the seated Apostles with the cities of Bethlehem and Jerusalem in the background. Around the base one frequently finds twelve lambs flanking the Lamb of God who stands on a small mound in the center bearing a cross. A famous example is the apse of S. Pudenziana in Rome which shows a composition similar to Raphael's *Disputa*.

CLEOPATRA. A marble statue by Story (1862); in the Metropolitan Museum at New York. An impressive work. Hawthorne took an interest in the conception and execution of the statue.

CLYTIE. A life-size nude marble statue by Rinehart (1872); in a special gallery in the Peabody Institute. A plaster cast is in the Corcoran Art Gallery. The modest grace and tenderness of the figure are delightful.

COCK FIGHT, THE. By Gérome and now in the Luxembourg Gallery in Paris. The fine drawing of the figures, both male and female, is due to the academic ideal of the time, which owes its origin to the doctrine of Ingres.

COLLEONI, STATUE OF BARTOLOMMEO. In the Piazza di San Giovanni e Paolo in Venice, by Verrocchio. He had the model of Donatello's *Gattamelata* on which to base his work, but has improved on that example. The general sits more firmly in his seat, and is more the center of interest than was the case in the *Gattamelata*. Dressed in contemporary armour, his personality and eagle glance are sufficient to control the troops in the field. The horse, too, is more secure on its pedestal. Probably it is the best equestrian statue of all time.

COLOSSUS OF RHODES. The statue of Apollo at Rhodes, standing at the entrance of the harbor, though not bestriding it as is frequently said, was over 100 feet high, and was one of the seven wonders of the ancient world. It was made of bronze, cast in sections, and occupied the artist twelve years. Erected about 380 B. C., it was overthrown by an earthquake in 224 B. C. It remained lying till Moawyia, general of the caliph Othman IV. sold it to a Jew who loaded its material on nine hundred camels.

COMMUNION OF ST. JEROME. Painted by Domenichino in 1614; now in the Vatican. One of the

ANCIENT SCULPTURE

1 Diana, The Louvre, Paris. 2 Laocoon, The Vatican, Rome. 3 Apollo Belvedere, Rome. 4 Venus de Milo, The Louvre, Paris. 5 Winged Victory, The Louvre, Paris.

Photos 1, 4 copyright by Ewing Galloway; 2, 3 by Keystone View Co.

AMERICAN SCULPTURE

1 Stone Mountain Memorial, Atlanta, Georgia, by Gutzon Borglum and Augustus Lukeman. 2 Pioneer Mother, Memorial Park, Kansas City, Missouri, by Proctor. 3 Lincoln Monument. 4 George Washington, State Capitol, Richmond, Virginia, by Houdon.

world's most celebrated paintings. St. Jerome is near unto death and is lying before the altar. He attempts to receive the Host from St. Ephraim of Syria. His faithful lion is near him; and, above, is a group of angels.

CORONATION OF NAPOLEON AND JOSEPHINE. Painted by David in 1808. It shows Napoleon in the act of placing the crown on his wife's head, having already crowned himself in the Cathedral of Notre Dame in Paris on December 6, 1804. Oddly enough, David did not consider this an historical canvas at all, since its subject was not classic. The canvas, measuring 33 feet by 20 feet, is in the Versailles Museum.

CORONATION OF THE VIRGIN. In the Uffizi Gallery in Florence. It was painted by Fra Filippo Lippi in 1441, for the nuns of S. Ambrogio. God the Father places a crown on the Virgin's head while to either side, a host of angels may be seen, and a group of nuns and monks fill the foreground, including the painter himself. Also painted by Velasquez in the Prado at Madrid; by Raphael in the Vatican in Rome; Fra Angelico in the Louvre, and the Uffizi in Florence; and Rubens, in Brussels.

COURTYARD OF A DUTCH HOUSE. Painted by Pieter de Hoogh, and now in the National Gallery in London. The immaculately clean house and its inmates have been rendered with fidelity and much domestic feeling. An interest in light effects is evident in the alternate passages of light and shadow; a lighted court, a passageway, and again an illuminated open space. This is emphasized by contrasting a matron in the sunlit foreground against a dark background with a silhouette of a second woman in the dark passage against a light background.

CRUCHE CASSEE or THE BROKEN PITCHER. Painted by Greuze; now in the Louvre. A young girl bears a broken or cracked pitcher on her arm. She stands beside a fountain. She is dressed in white, wears a violet ribbon, and carries flowers in her apron.

CRUCIFIXION. Treated by many famous painters. Fra Angelico in the Chapter House of San Marco in Florence portrays the scene from the standpoint of a religious mystery, the cross flanked by the patron saints of Florence and of the Medici family on the one hand and by the founders of monastic orders on the other. Tintoretto in the School of St. Roch in Venice takes a more historical attitude toward the subject, introducing the soldiers, the faithful few at the foot of the cross, the curious spectators and so on. Both are supremely fine compositions. Among other well known representations of this theme mention may be made of those by Lucas Cranach in the Stadtkirche at Weimar; Cellini in the Escurial at Madrid, in sculpture; the Byzantine mosaic at Daphni in Greece; Van Dyck, in Mechlin Cathedral; El Greco, in the Prado at Madrid; Andrea Mantegna, in the Louvre; Murillo, in the Hermitage of Leningrad; Perugino, in the Church of the Santa Maria Maddalena dei Pazzi in Florence; Rubens, in the Antwerp Museum; Titian in Ancona; and last, but not least, Velasquez, in the Prado.

CUPID AND PSYCHE. The classic myth represented by Canova in the Louvre, a work which was probably based on a painting of a nymph and satyr from Herculaneum. It shows the over-elimination of the neo-classic period, an exaggeration of the true classic ideal.

DANAE. The mother of the hero Perseus, wooed by Jupiter in the form of a golden shower. Frequently treated by artists. Among the best is that by Correggio in the Borghese gallery in Rome notable for its composition and its color.

DANCE, THE. A group forming part of the decoration of the Opera House in Paris by Carpeaux. The vivacity, the delicate sensuosity, and the almost pictorial light and shade are typical. The artist may have been influenced by Rubens.

DANCE OF THE ANGELS, THE. A portion of a panel showing the *Last Judgment*, by Fra Angelico in the Museum of San Marco in Florence. With gay Gothic coloring, a ring of figures frolic in a blooming celestial meadow or give way to ecstatic joy at reunion with loved ones.

DAVID. The slayer of Goliath, the Philistine (*I Samuel, 17*), has frequently been a theme for sculptors. Michelangelo's version in the Bargello shows a youth of powerful body and mind, imbued with the Christian vigor of the sculptor. The anatomy is perfect. Bernini gives the figure the agitated pose and emotional expression preferred by the seventeenth century. Donatello has modeled a slender nude youth, inspired by a pagan love of physical beauty. Verrocchio conceived the subject as a youth not entirely beyond the awkwardness of puberty nor quite able to conceal his boyish pride in his achievement.

DEATH OF THE VIRGIN. In the Louvre, painted by Caravaggio. It illustrates the concentrated, rather theatrical lighting of the studio and the types chosen from low life which the artist loved. There is little religious feeling. It was criticised at the time as being too natural and now for not being natural enough. This sort of work had a marked influence on the Spanish school through Ribera.

DEATH ON THE PALE HORSE. Painted by West in 1817; now in the Pennsylvania Academy. It is 25 feet long and 15 feet high. It is an interpretation of the sixth chapter of *Revelation*.

DEATH STAYING THE SCULPTOR'S HAND. Monument to Martin Milmore in the Forest Hills Cemetery in Boston by D. C. French. The Angel of Death, her cloak shading her face, restrains the young sculptor who is carving an Egyptian Sphinx in low relief.

DEJEUNER SUR L'HERBE. Painted by Manet and now in the Luxembourg. The subject is a picnic party in a wooded park, composed of two gentlemen in contemporary dress, and two nude women. The work is obviously a translation into modern terms of Giorgione's *Fête Champêtre* in the Louvre, but it shocked contemporary taste profoundly.

DELAWARE VALLEY, THE. A masterpiece of landscape painting by Innes. The placid valley with its hay carts is a typical theme of the Hudson River School of painters. It is in the Metropolitan Museum in New York.

DELFT FROM ACROSS THE RIVER. A landscape seen from the artist's studio by Vermeer in the Museum at The Hague. The light effects are varied, as cloud shadows play on the red tile roofs of the city.

DEMETER OF CNIDOS. A fourth century work of unknown authorship in the British Museum. Resignation is expressed in the head which is of marble, while the body is limestone. The nobility of the head and its deep set eyes have led some critics to connect the work with Scopas, assuming local workmanship to the body.

DESCENT FROM THE CROSS. A favorite subject with the great masters. Among the most famous are the paintings by Rubens, in the Antwerp Cathedral; Rembrandt, in the Munich Gallery; Andrea del Sarto, in the Pitti Palace at Florence; Titian, in the Venice Academy; and Van der Weyden in the Prado at Madrid.

DIADUMENUS. A statue by Polyclitus. A Roman copy of this is in the British Museum. It represents an athlete binding his brow with a fillet.

DIANA AND ACTAEON. Painted by Titian in 1559; now in Bridgewater House, London, owned by the earl of Ellesmere. With *Diana and Callisto* it forms the pair painted for Philip II. of Spain.

DIANA AND THE STAG. By the sculptor Jean Goujon. It represents the goddess seated and supported by a stag. The figure shows the elegance of proportion innate in the French temperament.

DIANA OF VERSAILLES. A Greek statue found in the ruins of Hadrian's villa at Tivoli; now in the Louvre. It is the most famous statue of the goddess. The goddess is advancing with one hand upon the head of a stag and the other drawing an arrow from a quiver.

DIGNITY AND IMPUDENCE. Painted by Landseer; now in the National Gallery at London. A sedate old bloodhound and a saucy Scotch terrier are side by side looking from the door of a kennel.

DISCOBOLUS. A Greek statue by Myron preserved in a number of copies, the two most famous in the Vatican and the British Museum, having the heads wrongly restored. The head should face back to the hand holding the discus. The pose is typical of the artist in that it represents a moment of repose between periods of violent action.

DISPUTA. A fresco in the Camera della Segnatura in the Vatican by Raphael. It introduces a host of witnesses culled from church history as a proof of the truth of the Holy Trinity and its earthly symbol, the Eucharistic Wafer. The design is finely decora-

tive, with three semicircles of figures, one above another, receding into the picture. One of the greatest decorations in the world.

DORYPHOROS. A statue by Polyclitus; now in the Naples Museum. It was long the standard of human proportion and was known as *The Canon.* It represents a young man holding a spear in the left hand.

DUCHESS OF DEVONSHIRE. Painted by Gainsborough in 1783 and by Reynolds.

DYING GAUL, THE. This famous statue in the Capitoline Museum, Rome, represents the passing away of a vanquished barbarian, at once a realistic and pathetic figure. This is a marble copy of a bronze statue executed in the time of King Attalus of Pergamus, about 240 B. C., and is sometimes erroneously called the *Dying Gladiator.*

EAST DOORS OF THE BAPTISTRY OF FLORENCE. Bronze doors, by Ghiberti. Ten scenes of biblical subjects give an impression of depth by the careful varying of the height of the relief. They are remarkable for the delicacy of execution and the grace of the figures. Michelangelo said they were "worthy to be the Gates of Paradise."

ECCE HOMO (BEHOLD THE MAN). The presentation in art of the passion and capacity for suffering of Christ; a favorite theme of painters. The most notable examples are by Correggio, in the National Gallery at London; Guido, in Dresden Gallery; Murillo, in Madrid and Cadiz galleries; and Titian, in Madrid and Vienna museums.

EGYPT AWAKENING. A statue by Elwell; in Paris. A typical Egyptian female figure, seated, with arms uplifted and stretching as one who has just awakened.

ELEVATION OF THE CROSS. Raising the cross after Christ had been fastened upon it; a favorite subject. The best are by Rubens, in the Antwerp Cathedral, and by Van Dyck, in Notre Dame at Courtrai, Belgium.

ELGIN MARBLES. Taken from Athens in 1803 by Lord Elgin and sold for £35,000 ($170,000) to the British government; now in the British Museum. Among them are parts of a frieze from the Parthenon. Considered the finest examples of ancient art. Probably the work of Phidias about 440 B. C.

EMBARKATION FOR CYTHERA. In the Louvre in Paris. The departure of a group of courtiers and ladies on a picnic, by Watteau, and embodying the spirit of the *Fêtes Galantes.* Although ostensibly a return to nature, the scene is in reality highly affected. Its crystal clear color and delicate execution typify the artist's work.

EMBARKATION OF THE QUEEN OF SHEBA. Painted by Claude Lorrain in the National Gallery of London. The fragments of classical architecture, the brown shadows, and the choice of subject are to be found in many of these "Italian Landscapes" but the lyric quality is peculiar to the artist. He was the first to introduce the sun into his paintings.

ENTOMBMENT. Bearing the body of Christ to the tomb. Among the most celebrated is that by Titian, in the Louvre, painted in 1523; owned by Charles I., and on his execution, passed on to Louis XIV. It is one of the most famous pictures in the world. Among the best known are those by Caravaggio, in the Vatican at Rome; Giotto in the Arena Chapel at Padua; Raphael, in the Borghese Palace at Rome; and Titian, in the Madrid Museum.

ERASMUS. This great cosmopolitan character is represented in a famous portrait by Holbein in the Louvre. Seated in profile, the character of the man has been most sympathetically rendered with fidelity and great beauty of technique.

ET IN ARCADIA EGO. Painted by Poussin. Figures of shepherds and shepherdesses in a classic landscape deciphering an inscription on an antique fragment. The figures are sculpturesque in effect, and well drawn, but the color contrasts of blue and red are not very pleasant.

EXECUTION OF MADRILENOS. An incident of the Napoleonic occupation of Spain showing a military execution at Murat's command. Goya first sketched the subject in the blood of the victims on a plaster wall. This bitter work suggests the horror of war. It is in the Prado at Madrid.

EXPULSION FROM EDEN. The scene is related in *Genesis 3* and has been frequently depicted by artists. In the Brancacci Chapel, Masaccio has represented the figures driven forth by the Angel of the Lord, Eve crying aloud with anguish, and Adam even more tragic, though his sorrow is silent. The scene also occurs on the ceiling of the Sistine Chapel painted by Michelangelo.

FARNESE BULL. A marble group credited to Apollonius and Tauriscus of the third century B. C.; found in the ruins of the Baths of Caracalla in 1546 and placed in the Farnese Palace at Rome; now in Naples Museum. Zethus and Amphion, sons of Antiope, are tying Dirce to the horns of a bull to punish her for ill-treating their mother.

FARNESE HERCULES. Credited to Glycon of Athens in the first century B. C.; perhaps a copy of the Hercules of Lysippus. Hercules stands leaning upon his club with his right hand behind him; found in the Baths of Caracalla in 1540; placed in the Farnese Palace; now in the Naples Museum.

FEDERIGO DA MONTEFELTRO. The duke of Urbino made his small state a center of learning and humanism in the fifteenth century. He is distinguished from the rest of the Italian princes of the time by his honesty. A pair of profile portraits in the Uffizi Gallery in Florence painted by Piero della Francesca about 1472 represent the duke and duchess. The outright realism of the painting is instanced by the break in the duke's nose caused by having its bridge carried away by a spear thrust in a battle.

FETE D'AMOUR. A typical painting of the School of the Fêtes Galantes reflecting the frivolous, but delicate spirit of the time of Louis XV. The clear colors and the refined suggestiveness, drawn with the most subtle touch are typical of Watteau. It is in the Gallery at Dresden.

FETE CHAMPETRE. Painted by Giorgione and now in the Louvre. A courtly youth strikes a chord on a lute while looking at a shepherd. A nude nymph or shepherdess listens while the courtier's aristocratic lover turns away to pour water into a fountain.

FLAYING OF S. BARTHOLOMEW. Painted by "Lo Spagnoletto" (Jusepe de Ribera). The coarse realism derives from Caravaggio. A strong but unpleasant painting in the Kaiser Friedrich's Museum in Berlin.

FOREST, IN THE. Painted by Diaz in the Louvre. The Barbizon school preferred modest landscapes treated with greater fidelity to nature than had those in the old "Italian manner." Here the warm sunlight filtering through the trees of a wooded glade is most effective.

FOUR EVANGELISTS, THE. Painted by Jacob Jordaens in the Louvre. A deep feeling of religious belief is apparent, such faith as was stimulated by the Catholic Counter Reformation. The massive figures are monumental in effect in spite of the vigorous naturalism of the types taken from humble life.

FOUR HORSEMEN, THE. The riders of the Apocalypse coming to destroy the world, a woodcut by Albrecht Dürer, and one of his greatest.

FRANCIS I., PORTRAIT OF. Painted by Jean Clouet, and now in the Louvre. Realism tempered by the French passion for beauty, extremely fine draftsmanship, and subtle characterization of the Renaissance ruler of France, a great and discriminating patron of the arts.

FRANCIS, ST., LIFE OF. Painted by Giotto in S. Francesco at Assisi, and in the Bardi Chapel of S. Croce in Florence. The massive figures are conceived with dignified solidity, and the composition of such scenes as the *Saint before the Sultan* and the *Death of the Saint* in the Bardi Chapel are masterfully handled.

FRIEDLAND. Painted by Meissonier in 1878; now in the Metropolitan Art Museum in New York. A review of the victorious French army after the battle of Friedland (1807), which made Napoleon dictator of Europe. The Twelfth Cuirassiers gallop through the trampled grain and salute Napoleon.

GANYMEDE AND THE EAGLE. A marble group in the Vatican, supposed to be a copy of the bronze statue by Leochares in Athens, representing Ganymede being carried to heaven by Zeus in the form of an eagle. Painted by Correggio, and now in the Belvedere at Vienna. The vertical panel is composed and held together by a single grand reversed curve passing through Ganymede and his dog.

GATTAMELATA. This first large equestrian statue since antiquity is by Donatello, and is at Padua. Garbed like a Roman emperor, the rider sits firmly on his horse, and has not only been characterized personally, but embodies the type of military captain for all time.

GAUL AND HIS WIFE, THE. A famous group from Asia Minor, in the third century B. C. of the Pergamene School, now in the Villa Ludovisi at Rome. The Gaul is killing himself after having killed his wife; one of the most pathetic studies of antiquity.

GENEVIEVE, ST. Scenes from the life of this patron saint of Paris by Puvis de Chavannes painted on the walls of the Pantheon in Paris. The deliberately chosen light colors of low intensity and the lack of realism make of these perhaps the best mural decorations of the nineteenth century.

GENTLEMAN AND LADY DRINKING WINE. In the Kaiser Friedrich's Museum in Berlin by Vermeer. The masterly composition of rectangular forms skillfully varied by just enough curves, the perfect relation of colors and values in light and shadow and the refined domesticity are noteworthy.

GEORGE, ST. A marble statue by Donatello originally on the Or San Michele, and now in the Bargello in Florence; a lifelike image of the warrior saint embodying the Christian ideal and revealing vivid naturalism, for which Donatello is famous.

GIORNO, IL:—THE DAY. Painted by Correggio in 1523; now in the Parma Gallery. The Virgin, holding Jesus, is seated with Magdalene on her right and St. Jerome, with lion, on the left.

GIRL WITH PARROT. By Manet in the Metropolitan Museum in New York. Color and texture are most successful and form has been suggested with very little shading.

GISZE, GEORGE, PORTRAIT OF. Painted by Holbein, in the Kaiser Friedrich's Museum in Berlin. A successful merchant of the Steelyard, whose character has been analyzed for all time by the painter's brush. The incidental details are most carefully depicted.

GUIDECCA, THE. A Venetian landscape in the Gallery at Leicester by Turner. Like many of this artist's works, rich atmospheric effects provide the opportunity for resplendent color.

GLEANERS, THE. Painted by Jean François Millet, and now in the Louvre. Large, almost burly peasant women are shown stooping to gather the remnants of the reaping. Such figures embody humanity's eternal struggle for existence, but by their strength are able to bear the burden. They might illustrate a sermon on the nobility of labor.

GRACES, THE THREE. Three nude female figures by Rubens in the Prado at Madrid. The bodies are heavy, rolling in exuberant flesh, and not at all the present day ideal, but are magnificently painted for all that. A sensual but vigorous work.

GRAHAM, THE HONORABLE MRS. Painted by Gainsborough, and a superb piece of painting. The aristocratic life of England, highly conscious of its distinction found its best interpreter in Gainsborough. It is in the National Gallery of Edinburgh.

GREEK SLAVE, THE. A marble statue by Hiram Powers in 1847. Now in the Corcoran Art Gallery at Washington. A nude figure of a woman, chained and exposed for sale in the slave market. Many copies were carved by Powers. It is one of the first nude statues produced by an American.

GUIDORICCIO DA FOGLIANO. A portrait of the Sienese general who was victorious in the Battle of Sassoforte. It is in the Palazzo Pubblico at Siena and was painted by Simone Martini in 1328. Although unrealistic in almost all details, it gives a surprisingly martial effect, and, probably because of the repeated curves, suggests movement far more than many naturalistic works.

HALE, NATHAN. A statue by MacMonnies; in City Hall Park, New York City. It represents the last moments of the patriot's life as he stands, bound, and utters his defiant words, "I only regret that I have but one life to lose for my country."

HAMILTON, LADY, AS A BACCHANTE. Painted by Romney. The famous character, mistress of Lord Nelson, depicted as a votary of Bacchus.

HAMPSTEAD HEATH. A beautifully composed landscape in the National Gallery in London, by John Constable. He introduced the newer realistic attitude toward landscape, later followed by the French Barbizon school. It is partially derived from Dutch landscape of the seventeenth century.

HAND OF GOD, THE. Sculpture by Rodin, representing a hand emerging from the uncut rock, and holding a man and woman in its grasp. The mystery is enforced by having portions of the stone left entirely uncut. It is in the Metropolitan Museum in New York.

HANGING GARDENS OF BABYLON, THE. One of the seven wonders of the ancient world created by Nebuchadnezzar for his queen Amytis. Great terraces bearing earth rose one above the other. Each was large enough to support great trees and the whole formed a huge garden.

HARVARD, JOHN, STATUE OF. By French (1882); at Cambridge. A very effective and artistic work.

HASTINGS, WARREN. Portrait painted by Lawrence in the National Portrait Gallery in London. The great ruler of India at whose trial for high crimes and misdemeanors many great orators spoke, including Fox and Burke.

HAYMAKERS, THE. Painted by Bastien Lepage and now in the Luxembourg. During the lunch hour two peasants are resting from their labors. The work shows the indistinct shadows of outdoors.

HAY WAIN, THE. One of the finest paintings by Constable, now in the National Gallery, London. It is a simple English landscape painted in the realistic style of this great innovator.

HEGESO, GRAVE STELE OF. One of the best of a long series of reliefs serving as tombstones and some in all probability, by the sculptors who worked on the Parthenon. As usual, there is a scene suggestive of parting and a vague melancholy, but no reference to death or even to old age.

HENRY IV. RECEIVING THE PORTRAIT OF MARIE DE MEDICI. One of a series of large allegorical works by Rubens and now in the Louvre. They were painted to celebrate the marriage of the French king and Marie de Medici, and are designed from a decorative point of view.

HERA OF SAMOS. An archaic Greek statue dedicated by Cheramyes, and now in the Louvre. The cylindrical form and certain details suggest that its ancestors were probably carved from the trunks of trees. Nevertheless, the fine lines are superior in design and decorative quality to those of many more realistic works.

HERMES OF PRAXITELES. Statue by Praxiteles; found in 1877 in the excavation of the Temple of Hera at Olympia. The god is holding the infant Dionysus on his arm; now in the Olympia Museum.

HESI, RELIEFS OF. Three wooden panels carved in low relief from the fourth dynasty in Egypt are in the Cairo Museum. They show a delicate feeling for material, and an exquisite skill of workmanship. The central panel is well composed, but the two side panels have allowed hieroglyphics to encroach too near the figure.

HILANDERAS, LAS, or THE TAPESTRY WEAVERS. Painted by Velasquez about 1656; now in the Madrid Museum. This masterpiece represents women at work in the royal tapestry factory of Santa Isabel at Madrid. The tapestry in the background reproduces Titian's *Europa and the Bull.*

HILLE BOBBE. Painted by Frans Hals about 1650; now in the Berlin Museum. The witch of Haarlem is seated at a table, an open beer stein before her, and an owl perched on her left shoulder. There is a similar picture in the Metropolitan Art Museum in New York.

HOLY FAMILY, THE. A favorite subject with the great painters. The most famous are by Fra Bartolommeo, at Panshanger House, England, and in the Pitti Palace at Florence; Michelangelo, in the Uffizi Gallery at Florence; Domenichino, in the Louvre; Bernardino Luini, in the Louvre; Murillo, in Madrid, at the Hermitage, in the Louvre, in the Metropolitan Art Museum at New York, and in the National Gallery in London; Sebastiano del Piombo, in the Baring Collection in London; Raphael, in the Louvre and at Munich; Rembrandt, in the Hermitage; Rubens, in the Hermitage, the Pitti Palace, Vienna Museum, and Windsor Castle; Andrea del Sarto, the Pitti

Palace, Louvre, and National Gallery; Titian, in the Louvre; and Paolo Veronese, in the Uffizi in Florence.

HOLY NIGHT. One of the great altarpieces painted by Correggio in 1529, and now in the Royal Gallery, Dresden. It is the birth of Christ, with the surrounding darkness made more intense by contrast with the light which radiates from the new-born babe and which illumines the Madonna and the faces of those around.

HOPE. Painted by Watts, and in the Tate Gallery in London. Represents a woman with bowed head, seated on the world listening to a strain of music from a single string of a lyre.

HORSE FAIR, THE. Painted by Rosa Bonheur in 1853; now in the Metropolitan Art Museum in New York. It is 8 feet high and 15 feet long.

HUGO, VICTOR, PORTRAIT OF. A fine statue of the great French novelist by Auguste Rodin in the Garden of the Palais Royale in Paris. The characterization is superb, and the head thoughtful.

HYMN OF DEPARTURE FOR WAR, THE. A sculptured group by Rude on the Arc de Triomphe de l'Etoile, in Paris. The figure of the War Goddess with drawn sword hovers above a group of young and old soldiers. It is filled with the thrilling patriotism of the *Marseillaise*.

ILARIA DEL CARETTO, TOMB OF. By Jacopo della Quercia in the Cathedral at Lucca. The calmly beautiful figure of the lady lying quietly asleep is one of the most restful in all art. On the sides of the sarcophagus classic babies carry heavy garlands of fruit and flowers.

IMMACULATE CONCEPTION, THE. Painted by Murillo in 1678; now in the Louvre; carried from Spain by Marshal Soult; sold in Paris, in 1852, to the French government for 615,000 francs, the largest sum paid up to that time for any picture.

INDUSTRY. A symbolic figure on one of the ceilings of the Ducal palace at Venice by Veronese. The figure fits well in the difficult T-shaped frame.

INNOCENT X. Painted by Velasquez, and in the Doria Gallery in Rome. A powerful characterization of that pope. A sketch or replica of this work is to be seen in Fenway Court in Boston.

INNOCENTS, FOUNTAIN OF THE. An architectural fountain with low relief panels of nymphs pouring water from jars resting on their shoulders. This Parisian fountain by Jean Goujon was not entirely completed according to the original design. The nymphs with their graceful figures and clinging drapery suggest comparison with the balustrade of the temple of Wingless Victory on the Acropolis at Athens. The reliefs are now in the Louvre.

IO. Painted by Correggio in 1530 for the Duke of Mantua who presented it to the emperor Charles V. It is now in the Belvedere at Vienna. Jupiter shrouded by mist can barely be discerned embracing the nude nymph.

IZARD, MR. AND MRS. RALPH, PORTRAIT OF. One of John Singleton Copley's best portraits, now in the Museum of Fine Arts at Boston. The figures have been freed from some of the awkwardnesses, but still retain a touch of provincialism. The most advanced taste at that time is indicated by the ruins of the Colosseum in the background and by antique statues.

JALEO, EL. A representation of a Spanish dancer, the yellow footlights shining up at her. In the background are musicians. The painting gives the twang of the instruments, the click of castanets, and the tapping of feet in a most suggestive way. It was painted by Sargent, and is beautifully placed with the light coming from below and enhancing the effect. It is in Fenway Court in Boston.

JAGUAR, DEVOURING A HARE. Bronze group by Barye in the Louvre, showing the result of his long and careful study of animals. The observation of wild beasts is most apparent in the cruel twist of the feline tail.

JAMES, ST., LED TO EXECUTION. Painted by Mantegna in the Eremitani at Padua. Interest in antique architecture, costume, and perspective is typically expressed. To obtain the desired illusion, the painting is placed above the eye of the spectator, and the scene takes place as though on a raised stage with no ground visible.

JEROME, ST., IN HIS CELL. An engraving by Albrecht Dürer showing the saint at work in his cell. The room is such a one as the artist must often have seen himself rather than the sort which the saint would have known. The lion of the saint lies quietly in one corner.

JOAN OF ARC. 1. In the Metropolitan Museum in New York, a painting by Bastien Lepage, done in 1880 shows the peasant girl looking at the visions of angels and knights which suggests her career. 2. In sculpture, she has frequently been represented on horseback at the head of her troops leading them to higher ideals like some spiritual angel, as in the statues by Fremiet and Dubois, or the saint praying devoutly as in Anne Hyatt's treatment in the Cathedral of St. John the Divine in New York.

JOHN THE BAPTIST, ST., BIRTH OF. In the church of Santa Maria Novella in Florence, a fresco by Domenico Ghirlandaio. The work is filled with the portraits of noble Florentines, but attains dignity and monumentality.

JOHNSON, SAMUEL, PORTRAIT OF. The dictator of English letters of the eighteenth century was painted by Reynolds and the work is now in the National Gallery.

JULIUS II. The portrait of the pope in the Pitti Palace in Florence by Raphael is one of the latter's masterpieces of portraiture.

JULIUS CAESAR. There are, of course, many portrait busts of the great Roman, some of which suggest his strength of character in a noble manner. For the most part, these busts are highly realistic.

JUPITER OF OTRICOLI. The bust of Jupiter found at the Umbrian village of Otricoli, and now in the Vatican Museum at Rome, is believed to have been copied from the historic Olympian statue, the famous masterpiece of Phidias, which was reckoned among the seven wonders of the ancient world.

JUSTINIAN, EMPEROR, AND EMPRESS THEODORA. Two fine mosaic panels in the choir of the church of S. Vitale at Ravenna. The royal pair, attended by ecclesiastics and courtiers, bring gifts to the church. Fine in its decorative effect, the color and unusual amount of individuality in the heads make these mosaics especially noteworthy.

KHAFRA, PORTRAIT OF. A colossal diorite portrait of this pharaoh of the fourth dynasty, in the Museum at Cairo is one of the best of Egyptian statues. His head is protected by the hawk with wings outstretched, and the face has a fine mixture of idealization and characterization. The monarch is almost divine in that impression of strength and justice tempered by mercy. It is in the museum at Cairo.

KNEELING MONK. In the National Gallery in London, painted by Zurbaran. Very simple, but most effective in its suggestion of piety. It imposes its unquestioning faith on the spectator.

LAOCOON. A celebrated group in the Vatican, the work of Agesander, Polydoros, Athenodorus of Rhodes, about 50 B. C. A Trojan priest, gripped in the deadly coils of the serpents, sees the life of his two sons being crushed out beside him, while he, tortured alike by his pain and powerlessness, utters a last cry of anguish. The pathetic group inspired the Laokoon of Lessing.

LAST SUPPER, THE. Painted by Leonardo da Vinci in 1498 on the wall of the refectory in the convent of Santa Maria Delle Grazie, at Milan. It is in oil and measures 15 feet high and 28 feet long. The refectory was used as a stable for dragoons in 1796. This, with dampness and repainting, has nearly destroyed it. Fra Angelico, Ghirlandaio, Murillo, Raphael, Holbein, Tintoretto, Titian, and Rubens have treated the same theme.

LAUGHING CAVALIER, THE. Painted by Frans Hals and now in the Wallace Collection in London. An encyclopedia of the smile might be compiled from Frans Hals's works. The color and technique are powerful.

LEO X., POPE, PORTRAIT OF. A famous portrait by Raphael in the Pitti Palace in Florence, Italy. Dressed in a loose white robe, with fur trimmed sleeves, red velvet collar and cap, the Pope sits at a table with a book before him, holding an eyeglass in one hand. Behind him stand his two nephews, Cardinal Giulio de' Medici (Clement VII.) at the right, and Cardinal Luigi de' Rossi, his secretary, at the left. One of the most celebrated portraits in the

world. It was carried to Paris in 1797, returned in 1815.

LIBERTY LEADING THE PEOPLE. An allegorical figure of Liberty flanked by a youth and a man of the middle class, leading a motley group over the barricades of July 28, 1830. A fine mixture of realism and symbolism, of determination to be forever rid of the Bourbon Dynasty. Painted by Delacroix and now in the Louvre.

LIGHT OF THE WORLD. Painted by William Holman Hunt in 1854; now in Keble College at Oxford. Christ stands before a closed door, bearing a lantern in his hand.

LION OF LUCERNE. Carved by Thorwaldsen on the face of a cliff at Lucerne, in Switzerland. It is of colossal dimensions and represents a crouching lion pierced by a spear and dying; to commemorate those of the Swiss Guards who died defending Louis XVI. in the Tuileries during the Revolution (August 10, 1792).

LOREDANO, DOGE, PORTRAIT OF. A distinguished portrait by Giovanni Bellini in the National Gallery in London remarkable for its rich color harmonies.

"LUDOVISI THRONE." In the Museo delle Terme at Rome. A U-shaped block carved on the three outer sides. The front shows the birth of Aphrodite. Veiled in dripping garments the goddness rises from the waves with two attendants on either side. The ends of the throne depict a nude woman and a draped female figure respectively; generally interpreted as two aspects of the worship of love. Although its use has not been absolutely established, it seems likely that, with the "Boston Throne," it served as a decoration on one end of an altar.

LUKE, ST., DRAWING THE VIRGIN. Painted by Roger van der Weyden. There are replicas of it in the Hermitage at Leningrad, in Vienna, in Munich, and in the Museum of Fine Arts in Boston. The composition shows St. Luke on one side, the Virgin and Child on the other, while between is a landscape seen through three openings which was derived from Van Eyck's *Madonna of the Chancellor Rolin.*

MADONNA. The Virgin, generally with the Infant Christ, and frequently with subsidiary figures, was a favorite theme of painters. The following examples are noteworthy:

Madonna of the Burgomaster Meyer. Painted by Hans Holbein the Younger in 1525–6. It is now in the Museum at Darmstadt. Probably the best of Holbein's religious works. The pious but worldly donor and his wife appear at the sides.

Madonna of the Canon van der Paele. A matter of fact work in Bruges painted by John van Eyck with great beauty of finish and detail. On the left stands St. Donatien, the Bishop of Bruges, and to the right, a slightly awkward St. George presents the heavy donor. Though the individual figures, especially the donor, are not handsome, the work is powerful and satisfying from a technical standpoint.

Madonna del Cardellino or Madonna of the Goldfinch. By Raphael in 1506; now in the Uffizi at Florence. St. John offers a goldfinch to the Child.

Madonna of the Chancellor Rolin. Painted by Jan van Eyck in 1426 and now in the Louvre. The donor kneels at one side with the Madonna and Child at the other. An angel crowns the Virgin. Beyond, through a triple arch is a fine landscape background. The composition was inherited by the Flemish school and was frequently used by van der Weyden.

Madonna and Child. In the Uffizi Gallery in Florence by Cimabue. Influenced by Cavallini, a new life and spirit are evident, an attempt to give vitality to old forms inherited from Byzantium.

Madonna and Child. In the Palazzo Pubblico at Siena by Guido da Siena. One of the most disputed paintings in the world. It is signed and apparently dated 1221, though some authorities have questioned the date.

Madonna and Child. In the Pitti Palace in Florence by Fra Filippo Lippi. The model for the Madonna was probably Lucrezia Buti, the mistress and later the wife of the painter. A masterly composition in a circular frame.

Madonna and Child. In the lower church of S. Francesco at Assisi by Pietro Lorenzetti. On either side of the Virgin are SS. Francis and John. The beginning of tender affection between the Mother and Child.

Madonna del Coniglio, or Madonna of the Rabbit. By Titian in 1530; now in the Louvre. St. Catherine, with Jesus in her arms, stoops to look at a rabbit which the Virgin holds in her hand.

Madonna di Foligno. By Raphael in 1511; now in the Vatican at Rome. The Mother and Child look down from the clouds upon St. Jerome, St. Francis, and St. John the Baptist. Formerly in the Convent of St. Anna at Foligno.

Madonna del Granduca. An early example of Raphael's Madonna in the Pitti Palace at Florence. The half length figure of Mary is standing holding the Child in her arms. Its winning simplicity is reenforced by beautiful color.

Madonna of the Magnificat. This Madonna by Botticelli in a circular frame is a magnificent example of composition within that difficult space. The Virgin's face bears an expression of delicate melancholy. It is in the Uffizi Gallery in Florence.

Madonna del Pesce or Madonna of the Fish. By Raphael about 1514; now in the Madrid Museum. On the left of the enthroned Mother and Child the archangel Raphael presents Tobias holding the miraculous fish.

Madonna of the Rocks. By Leonardo da Vinci; now in the National Gallery in London. The Child is seated upon the ground blessing the infant St. John. In the background there is a grotto and high rocks. This is a replica, with some modifications, of the one in the Louvre.

Madonna Rucellai. Hanging in the church of Santa Maria Novella in Florence. This great painting is erroneously ascribed by Vasari to Cimabue. The work is certainly Sienese, and is probably by Duccio in 1285.

Madonna del Sacco or Madonna of the Sack. By Andrea del Sarto in 1525; now in SS. Annunziata de' Servi at Florence. At the left of the Mother and Child St. Joseph leans upon a sack reading.

Madonna della Sedia or Madonna of the Chair. By Raphael in 1516 and 1517; now in the Pitti Palace at Florence. The Virgin, seated in a chair, clasps the infant Jesus in her arms, with the infant St. John on the right in adoration.

Madonna di San Sisto, or *the Sistine Madonna,* or *the Madonna of St. Sixtus,* by Raphael in 1518; now in the Dresden Gallery. The Virgin, holding Jesus in her arms, stands upon clouds, surrounded by a glory of cherubim, between green curtains. On the left St. Sixtus (Pope Sixtus II.) kneels; St. Barbara on the right; and two angels lean upon a balustrade below.

Madonna with St. Anna. By Leonardo da Vinci; now in the Louvre. The Virgin, seated upon the knee of Santa Anna, leans forward to take the Child, who caresses a lamb.

Madonna of the Trees. In the Academy at Venice by Giovanni Bellini. Typical of his half length Madonnas. Behind the Virgin is a curtain with a tree on each side. The unobtrusive but heartfelt religious feeling, the solid qualities without a trace of ostentation make of this work a masterpiece.

MAIDS OF HONOR, THE:—LAS MENINAS. A masterpiece of Velasquez in the Prado at Madrid. It has been called a "Theology of Painting" by Luca Giordano. Velasquez himself is seen at work on a large canvas, while the Infanta with her ladies-in-waiting have come to look on. Four different sources of light are included, atmospheric effects are accurately rendered, and the composition, while not in the least obvious, is so carefully adjusted that not a line may be changed.

MAJA DESNUDA. Panel of a nude woman reclining on a couch, painted by Goya, in the Prado at Madrid. A more passionately sensual work would be difficult to find.

MAJA VESTITA. The model of the Maja Desnuda has been clothed, but the pose and expression are, if anything, more seductive than before. The composition has been improved by a more pronounced emphasis on the diagonal. Like the last, it is by Goya in the Prado. It is erroneously supposed that the Duchess of Alba was the model.

MAJESTAS. The Madonna enthroned in majesty and surrounded with a gálaxy of saints and angels. The altarpiece of the high altar of the cathedral of Siena, now in the Opera del Duomo at Siena was painted by Duccio in 1308–11. The rich green and gold of this painting is splendid in effect, and its drawing has seldom been surpassed. The work also included panels as a predella (base) and fifty-two panels of scenes from the life of Christ on the back giving us our basis for a knowledge of the master's style. The subject was also treated in fresco by

Simone Martini in 1315 in the Palazzo Pubblico at Siena.

MAN OF SORROWS. Albrecht Dürer in 1500 represented himself as the Man of Sorrows. The painting is in the Pinakothek at Munich. It is a very serious work. The hair is represented in stringy locks after the fashion of this artist.

MAN WITH THE GLOVE:—L'HOMME AU GANT. A noted portrait painted by Tiziano Vecelli, or Titian, as he is more popularly called. It is in the Louvre, Paris. It is an interesting specimen of the work of the greatest painter of the Venetian school.

MAN WITH THE HOE. Painted by Jean François Millet in 1862. It represents a weary peasant leaning upon a clumsy hoe. It suggested Edwin Markham's well-known poem written in 1899.

MAN WITH PINK. In the Kaiser Friederich's Museum at Berlin by Jan van Eyck. The subject has sometimes been identified as Count Wilhelm IV. of Bavaria. It is very realistic, and the contrast of the stern character of the sitter and the delicate pink is most effective.

MARAT, DEATH OF. The revolutionary hero murdered while in his bath by Charlotte Corday. Painted by Jacques Louis David is in the Museum at Brussels. Contemporary scenes and stark tragedies are unusual in his work.

MARBLE FAUN. A young satyr, leaning against a tree trunk, by Praxiteles in the Capitoline Museum at Rome. A better but more fragmentary copy exists in the Louvre. The semi-bestial character has been almost entirely suppressed physically, but is betrayed by the lighthearted, carefree impression of the work. It was made the subject of a book by Hawthorne.

MARIA LOUISA DE TASSIS, PORTRAIT OF. By Anthony Van Dyck in the Liechtenstein Gallery at Vienna. The distinction, the innate aristocracy, and the beauty of color and technique were passed on to the later English portrait school through such works as this.

MARKET GIRL, THE. A simple domestic genre scene of a housemaid with a market basket, and other small genre subjects brilliantly depicted by Chardin are now in the Louvre.

MARLY, HORSES OF. Sculptured figures in the Champs Elysées in Paris by Guillaume Coustou. They were probably inspired by the antique horse trainers on the Quirinal in Rome. The lively action, and the technical facility foretell the rococo style.

MARRIAGE A LA MODE. A series of six well-known pictures by Hogarth, painted about 1750; now in the National Gallery in London.

MARRIAGE OF S. CATHERINE. Painted by Correggio and now in the Louvre. The charming feminine types have but little religious feeling in spite of their attractiveness. Outlines have been somewhat eliminated by shading producing a soft effect.

MARRIAGE FEAST AT CANA. Painted by Paolo Veronese in 1563; in the Louvre. Based upon *John II;* 1–12. One of the largest easel canvases ever painted—21 feet wide and 31 feet high. There are in it over 130 figures, portraits of contemporaries, in Venetian costume. Although the figure of Christ is placed well back in the picture, the eye is skillfully focused upon Him by many devices of composition. Another famous version is by Tintoretto in S. Maria della Salute in Venice.

MARRIAGE OF THE VIRGIN. Painted by Raphael, and is now in the Brera Gallery in Milan. The work has been influenced by Perugino's fresco of Christ delivering the keys to St. Peter. A group of disappointed suitors break their rods.

MARTYRDOM OF ST. DENIS. Painted by Bonnat. This brutal work depicts the moment when S. Denis reaches out for his head which has just been cut off. The executioner starts back in amazement.

MARY, QUEEN, PORTRAIT OF. Painted by Antonis Mor and in the Prado at Madrid. Her stern character is faithfully expressed.

MASSACRE OF SCIO. Painted by Delacroix in 1824; now in the Louvre. The canvas—13 feet 10 inches by 11 feet 6 inches—depicts many Greek families upon the shore, after the massacre, awaiting their fate. A Turk is dragging a young girl fastened to his horse, while the city is burning in the distance.

MAXIMIANUS, ARCHBISHOP, THRONE OF. A magnificent chair of ivory with rich carving on it in the Museum at Ravenna. Probably dates from the sixth century. Several of the panels tell of the story of Joseph, while others show isolated, elongated figures of saints.

McNAB, THE. A portrait by Raeburn in a private collection. The subject, head of a Scotch clan, is dressed in kilts. It is painted with great distinction.

MEDICI TOMBS. In the new sacristy of the Church of San Lorenzo in Florence. These tombs by Michelangelo are of Lorenzo, the Duke of Urbino, and Giuliano, the Duke of Nemours. In each case, the portrait is seated in a niche above a sarcophagus on which rests figures of *Dawn* and *Twilight* and *Day* and *Night,* respectively. The powerful forms are expressive of Michelangelo's dismay at the subversion of Florentine liberty, and express ineffable woe.

MEDUSA, RAFT OF THE. Painted by Jean Louis Géricault (1791–1824) in 1819. The *Méduse* was wrecked (July 2, 1816) on her way to Senegal. The passengers sought safety on a raft. Of 149, only 15 survived the privations of 12 days. The canvas measures 23½ feet by 16 feet. It is in the Louvre.

MELEAGER. The Greek hero who lost his life hunting the boar was modelled by Scopas. The most complete copies are in the Old Museum, Berlin, and in the Vatican, but the Fogg Museum, Cambridge, Massachusetts, has a figure which, though missing its limbs, has greater life.

MELANCHOLY. An allegorical figure, resting her chin moodily on her hand was engraved by Albrecht Dürer.

MERCURY. A flying bronze figure of the messenger of the gods by Giovanni Bologna in the Bargello in Florence. One foot rests on a jet of air blown from the mouth of the wind god. The effect is graceful, and the technique masterly.

MIDDLEHARNIS AVENUE. An early work by Hobbema, noted for its truth of atmospheric effect and for tone and brilliance of color. The symmetrical design is good. It is in the National Gallery at London.

MILAN, DUCHESS OF, PORTRAIT. The princess of Denmark, Maria Christina, painted by Holbein, and now in the National Gallery in London. Dressed in simple black robe, the portrait owes its effect to the perfect composition and drawing and the sensitive characterization.

MILO OF CROTON. A statue of a nude man, being devoured by a lion, while his fingers are caught in a tree trunk. It is the work of Puget, and is in the Louvre.

MINUTE MAN, THE. Statue by French (1873); in Concord. This was the great sculptor's first work, with almost no tuition. A wonderfully clever first effort.

MIRACLE OF ST. MARK. Painted by Tintoretto about 1548; in the Venice Academy. St. Mark flies down from heaven and prevents some Turks from torturing a Christian prisoner stretched upon the ground and surrounded by executioners and others. Regarded as the artist's greatest work.

MOENIPPUS. Painted by Velasquez, and now in the Prado. The old beggar is dressed in a rusty robe of black which is enriched by a play of greenish light.

MONA LISA. Painted by Leonardo da Vinci in 1500–1504; now in the Louvre. It is the portrait of Mona or Madonna or Madame Lisa Gherardini, third wife of Francesco del Giocondo; hence she is known as La Gioconda. Her face bears a remarkable, mysterious smile. Stolen Aug. 1911; recovered in Florence, Dec. 1912.

MORNING. A typical filmy landscape by Corot in the Louvre with its soft colors which nevertheless create solid tree forms. It is also the title of a landscape with cattle by Troyon, also in the Louvre.

MOSES. A statue by Michelangelo, originally sculptured for the tomb of Pope Julius II., but now in the Church of San Pietro in Vincoli in Rome. It is a marvelous creation, full of repressed wrath and passion. The massive figure of Moses on a Calvary over a well in the Monastery of Champmol near Dijon by Claus Sluter is a majestic figure lacking the passion of Michelangelo's work, but with power and immense dignity of its own.

NAPOLEON IN THE PEST HOUSE AT JAFFA. Painted by Baron Gros and now in the Louvre. An

incident of Napoleon's eastern campaign, portrayed without concealing the unpleasant.

NAPOLEON IN THE RETREAT FROM RUSSIA. Painted by Meissonier in 1865; now in the Wallace Collection in London. Napoleon and his staff retreat along an icy road, while the army crowds along in a parallel line. It is sometimes called the *Retreat from Moscow*.

NATIVITY, THE. A favorite subject with painters. Among the best are pictures by Annibale and Ludovico Carracci, in the Louvre; Correggio (Holy Night), in Dresden Museum; Domenico Ghirlandajo, in Dresden Museum; Giulio Romano in the Louvre; Filippo Lippi, in Florence Academy; and Rembrandt, in Munich Gallery.

NIGHT WATCH, THE. In the Ryks Museum at Amsterdam by Rembrandt in 1642. It shows the march out of Frans Banning Cocq's Company of the Civic guard, and strangely enough, is painted in broad daylight.

NIKE:—VICTORY. Statue of the goddess of victory by Paeonius about 436 B. C.; found in the German excavation at Olympia of 1875. The head and arms are missing. The goddess has just alighted with her garments floating behind. The *Nike of Samothrace* in the Louvre was probably erected to celebrate the victory of Demetrius Poliorcetes over Ptolemy in 306 B. C. The colossal figure flutters down on the prow of a vessel, her loose drapery swirled by the wind, and giving the desired impression of motion. The statue was reconstructed from over 575 fragments found in 1863 by the French consul at Adrianople and a few more added by the Austrian expedition of 1875.

NIOBE GROUP. A series of figures representing Niobe and her children being slain by the arrows of Apollo and Artemis. Quite a few figures of the group, rather dry in execution, are in the Uffizi Gallery in Florence. The *Chiaramonti Niobid* in the Vatican in Rome, of a fleeing daughter of Niobe, is one of the finest of ancient statues with a feeling of motion and of agitation combined with a decorative effect worthy of the greatest artist. Ancient writers said the group was either by Praxiteles or by Scopas, a ridiculous statement. It certainly is not by Praxiteles, and its connection with Scopas is by no means assured.

NORTH DOORS OF THE BAPTISTRY OF FLORENCE. By Lorenzo Ghiberti. The arrangement is similar to the medieval doors by Andrea Pisano with 28 quatrefoil panels, mostly of scenes from the life of Christ. A little more grace and refinement obtained at the expense of architectonic feeling indicates the new spirit as do the naturalistic floral borders.

OAKS. By Theodore Rousseau and now in the Louvre. The strength of this tree appealed to this artist of the Barbizon school who at times treated it with great success.

OATH OF THE HORATII. Painted by Jacques Louis David in 1785; now in the Louvre. The Horatii receive the swords from their father and swear to conquer the Curiatii or die.

OBSERVATORY, FOUNTAIN OF THE. In the gardens of the Luxembourg by Carpeaux and Fremiet, in 1874. The central motive is composed of bronze figures supporting a globe, in the basin, at its base are bronze horses and dolphins.

OLYMPIA. A portrait of a nude female figure by Manet now in the Louvre. The realism, illustrated by the fact that a celebrated courtesan was used for a model; and the introduction of the black cat profoundly shocked the taste of the period. The dark values in the composition afforded a fine contrast to the lighter flesh tones.

OLYMPIAN ZEUS. A gold and ivory statue of the Father of gods and men in the temple of Zeus at Olympia, created by Phidias, was one of the seven wonders of the ancient world. It was a seated figure about 40 feet high and all possible surfaces of the throne and footstool were covered with reliefs. The work embodied for all time the power and majesty of the god, tempered by kindliness, but the only copy which seems closely to reflect the original is a fourth century head in the Museum of Fine Arts in Boston.

PARLIAMENT, HOUSE OF. A series of paintings by Claude Monet showing Barry's masterpiece in many different effects of light and atmosphere, most of them having fine broken color.

PARNASSUS. Painted by Raphael in 1511; a fresco in the Camera della Segnatura of the Vatican at Rome. Apollo, with the Muses about him, sits playing a lyre on the summit of a mountain. Many illustrious poets are grouped in the foreground.

PAUL III. AND HIS NEPHEWS, PORTRAIT OF. Painted by Titian, in the National Museum at Naples. Color is here subordinated to tone. The crafty old pope sits crouched in his chair with his nephews behind and beside him—Ottaviano and Alessandro Farnese,—their smooth appearance rather emphasizing their treacherous character.

PEACE AND PLENTY. In the Metropolitan Museum in New York, painted by Inness. The warm tones, the luxuriant countryside, and a general air of contentment are evident.

PERGAMUM ALTAR. An Ionic colonnade surrounding an altar on three sides, the whole resting on a base decorated with a colossal frieze 7½ feet high, showing the struggle of the Gods and Giants. Great ingenuity, detailed knowledge of minor mythological characters, each with his appropriate attributes, and a skillful composition are apparent. The figures themselves are overmuscular and restless in effect. The groups of Athena, and Zeus are perhaps the best. It is now set up in Berlin. The altar was built under Eumenes II., 197–156 B. C.

PHILOSOPHER IN MEDITATION, THE. A painting by Rembrandt in the Louvre. The light of the single window falls on the old man, his head bowed in thought. Through the shadows of the rest of the canvas enough light filters to make visible the room with its staircase.

PIAZZA SAN MARCO, VENICE. Painted in 1492 for the School of S. Marks by Gentile Bellini, and now in the Academy at Venice. The famous square and its still greater church is represented on a feast day with fidelity and the splendor of pageantry dear to Venetian artists.

PIETA. The lamentations of the Virgin and others over the body of Christ. Among the most famous are those by Correggio in the Parma Gallery; Van Dyck, in Munich; Quentin Massys, in Antwerp; Michelangelo in St. Peters, Rome, Perugino, in Florence Academy; Rubens in Brussels; Andrea del Sarto in Vienna; and Titian in the Venice Academy.

POLLICE VERSO. A gladiatorial combat, painted by Gérôme, shows the victor looking to the Vestal Virgins for the signal granting life or death to the conquered. With one accord, the Virgins turn their thumbs down thereby condemning the loser to death.

POMPADOUR, MME. DU, PORTRAIT OF. Painted by François Boucher, in the National Gallery at Edinburgh. The famous mistress of Louis XV. who did so much for the arts of the time, is seen dressed in the height of fashion, and reclining on a couch.

PORTINARI ALTARPIECE. A huge painting made for Tommaso Portinari, agent of the Medici in Ghent, by Hugo van der Goes, and sent to Florence where it was set up in the church of S. Maria Novella in 1478. The subject is the *Adoration of the Shepherds*, who are represented by ungainly peasants coming from the fields and painted with true Flemish realism. This is one of the most important paintings in the world from an historical standpoint, in that it showed the Italians the Flemish oil technique with its dark shadows and realistic details. The work is now in the Uffizi Gallery in Florence.

PRESENTATION OF THE VIRGIN, THE. Tintoretto painted this subject about 1548 in the church of S. Maria dell' Orto in Venice, placing the little figure of the Virgin, outlined against the sky and set back within the picture. A better known version is by Titian in the Academy at Venice.

PROPHETS, THE. By Sargeant in the Boston Public Library. The biblical characters are skillfully grouped about Moses and beautifully characterized. The figure of Hosea clothed and hooded in heavy white drapery is perhaps the best.

PSAMTIK NEITH, HEAD OF. A priest's head of the Saite period of Egyptian art remarkable for its careful observation of nature in the contours of the skull and the winkles of the face.

PULPIT OF THE BAPTISTRY AT PISA. By Nicola d' Apulia about 1260. The work inspired by the antique is hexagonal in plan with reliefs from the life of Christ on each face. The compositions are

dignified and massive especially the one representing the nativity.

PULPIT IN THE CATHEDRAL OF SIENA. Somewhat later than the previous pulpit, but also by Nicola d'Apulia aided by his son, Giovanni Pisano. Here we find more humanism and more realism, but rather less dignity.

RAIN, STEAM, SPEED. In the Tate Gallery in London by Turner. A railroad train crossing a viaduct. Remarkable for the atmospheric effects of smoke, mist, and color.

RAKE'S PROGRESS, THE. Eight pictures painted by Hogarth in 1735; now in the Soane Museum. They represent the life of a profligate young man who ends his days in madness and poverty.

RAMESES II. Four colossal statues of the great Pharaoh, over 60 feet high, carved from the cliff before his rock cut temple at Abu-Simbel. In spite of the size, great kindliness and dignity has been impressed on the features of the ruler. He was probably the Pharaoh who oppressed the Israelites as told in the *Book of Exodus*. A fine portrait statue of the Monarch may be seen in the Museum at Turin.

RAPE OF PSYCHE. By Prud'hon in the Louvre. Psyche, while asleep, is borne away by Zephyr, the west wind, to her lover Cupid. The softness and feminine quality echo Correggio.

RAPE OF THE SABINES. Romans seizing Sabine women for wives on the founding of Rome. The most notable examples are paintings by Luca Giordano, in Dresden Museum; Nicolas Poussin, in the Louvre; Rubens, in the National Gallery at London; and Jacques Louis David, in the Louvre.

RECAMIER, MME., PORTRAIT OF. In the Louvre by Jacques Louis David. Dressed in the short-waisted, white gown of the period, and reclining on a day bed of the "Empire" style. The drawing is perfect, the color is restful, and the work does not lack elegance.

RESURRECTION, THE. The most noted examples are by Annibale Carracci, in the Louvre; Filippino Lippi, Munich Gallery; Piero della Francesca, Borgo San Sepulchro; Signorelli Chapel of S. Brixio, Orvieto; Perugino, the Vatican; Raphael, the Vatican; Rembrandt, Munich Gallery; and Tintoretto, Pitti Palace.

RICCARDI PALACE CHAPEL. Decorated with frescoes representing the *Adoration of the Kings* by Benozzo Gozzoli, painted about 1469 in the private chapel of the palace of the Medici in Florence, gay and delightful pageantry, expressive of a fertile imagination.

ROMAN, EMPEROR AND EMPRESS EUDOXIA. These eleventh century rulers of the Eastern or Byzantine empire are being crowned by Christ in a fine ivory in the Bibliothèque, Nationale in Paris. The scene is exactly balanced, but designed with splendid simplicity and great feeling for the material.

ROMANS OF THE DECADENCE. A group of luxurious Romans of the later empire, when the stern standards of the Roman Republic had been relaxed, are portrayed at a feast, reclining on couches. The work by Couture, hangs in the Louvre.

SACRED AND PROFANE LOVE. Painted by Titian about 1503; in the Borghese Palace at Rome. Two women, seated at a fountain in a garden.

SALISBURY CATHEDRAL. Painted by Constable, in the South Kensington Museum in London. The fine old thirteenth century Gothic building is enframed by trees.

SCHOOL OF ATHENS. Painted by Raphael in 1511; in the Vatican. It shows a vast portico, having the niches filled with statues of Plato, Aristotle, Diogenes, Alcibiades, Xenophon, Pythagoras. Democritus, Epicurus, Pyrrho, Arcesilaus, Archimedes, Ptolemy, Zoroaster, Raphael, and Perugino.

SCRIBE, SEATED. Two well-known versions of this subject. The better is in the Louvre. It is a fine example of the observation of nature by Egyptian artists of the fifth dynasty, the alert head and the flabby flesh of the breast suggesting a sedentary life. Another example from the same period is in the Museum at Cairo.

SEBASTIAN, ST. Painted by Annibale Carracci, in the Louvre; Anthony van Dyck, in the Louvre and at Munich; Guercino, in the Pitti Palace; Guido, in the Pitti Palace, the Louvre, and Bologna Gallery; Mantegna in Vienna; Rubens, in Berlin; Titian, in the Hermitage, Harrach Gallery at Vienna and the Vatican; Eugéné Delacroix, in the church of Nantua in France, and Camille Corot, in the Walters Collection at Baltimore. The saint, commander of a company of praetorian guards, was bound to a stake and shot to death with arrows, by order of the emperor Diocletian, for becoming a Christian.

SEINE AT GIVERNY. A landscape by Claude Monet of which innumerable versions were produced by the artist. Each interpreted a different atmospheric effect.

SELF PORTRAIT. Many painters like to reproduce their own features as seen in a mirror. One of the best is that by Hogarth in the Tate Gallery, London, a half length showing the artist and his dog.

SETI I. OFFERING TO OSIRIS. A low relief from the rock cut temple of Seti at Abydos from the nineteenth dynasty. Though none of the conventions common in figure sculpture of the Egyptians are omitted, the extreme delicacy of the work, its elegance, and composition are masterly.

SETI MEMPTAH. The great monarch of the nineteenth dynasty carved in sunken relief with a fine feeling for rhythmic line.

SHAW MEMORIAL. By Saint-Gaudens; in Boston. A large relief in bronze in commemoration of Colonel Robert Gould Shaw, who led the first regiment of colored troops organized in Massachusetts. A wonderfully great work.

SHEIKH-EL-BELED. A fourth dynasty statue in wood of Kaaper, a minor official of the Pharaoh, possibly an overseer of some of the workmen employed on the pyramids. The desire for a lifelike impression is evident at first glance. It is in the Museum at Cairo.

SHEPHERDS, ADORATION OF THE. Among the most notable of the many pictures on this subject are those by Raphael Mengs in Madrid; Murillo, in Madrid, Seville, and the Hermitage; Rembrandt, in the National Gallery at London; Velasquez, in the National Gallery at London; Nicolas Poussin, in the Munich Gallery; and Titian, at Milan.

SHEPHERDS IN ARCADIA. An epic landscape by Nicolas Poussin in the Louvre. Figure of shepherds, obviously inspired by Roman reliefs, stooping to read an inscription on a classic altar. The painting is in the Louvre.

SHERMAN, STATUTE OF. By Saint-Gaudens; in Central Park, New York. Remarkable for the artistic conception of the attendant figure of *Victory*.

SHRIMP GIRL, THE. A girl bearing on her head a basket of shrimps. The vivacity and the skillful building up of the surfaces make of this painting by Hogarth in the Tate Gallery one of the masterpieces of English art.

SIDDONS, MRS., AS THE TRAGIC MUSE. Painted by Sir Joshua Reynolds in 1784; in Grosvenor House in London. Sarah Siddons sits enthroned upon the clouds and is attended by two tragic figures.

SINGING GALLERY. The carved balconies by Donatello and Luca della Robbia in the Cathedral Museum in Florence. Both are fine examples of the sculpture of the fifteenth century in Italy. The latter, divided into square panels, has scenes of children and young people singing, dancing, and playing musical instruments. It is a translation into marble of the *150th Psalm*.

SISTINE CHAPEL. In the Vatican built by Pope Sixtus IV. Its walls received 16 panels of scriptural subjects, about 1481, including work by Botticelli, Signorelli, Ghirlandaio, Pinturicchio, and the best scene of all, *Christ Delivering the Keys to St. Peter*, by Pietro Perugino. The Ceiling, the greatest decorative undertaking of all time was completed by Michelangelo in 1512. Scenes from the creation and other episodes related in *Genesis* form the nucleus. Below are figures of prophets and sibyls and the whole is united by hundreds of superb nude figures illustrating Michelangelo's perfect control over the human figure. The end wall is covered with a huge fresco of the *Last Judgment*, executed by Michelangelo between 1534 and 1541. It is more vehement, but less successful than the ceiling.

SLAVE SHIP, THE. Painted by Turner; owned privately in Boston, Mass. A slave ship, storm-driven, goes ashore; many of the slaves are thrown

overboard and are seen manacled and struggling in the waves. Ruskin owned it for a long time; John Taylor Johnston of New York bought it from him; and at Johnston's sale in 1876 it brought $10,000.

SLEEPING VENUS. Painted about 1505 by Giorgione and now in the Museum at Dresden. A nude goddess lies asleep on the ground. It is the first of a long series of works dealing with the reclining nude female figures, but none have attained a purity and indefinable poetry expressed in this work by Giorgione.

SONG OF THE LARK. In the Institute of Fine Arts at Chicago, by Jules Breton. A young girl reaper with a sickle in her hand stops working, to listen attentively to the bird's song.

SOWER, THE. Painted by Jean François Millet in 1850; in the Vanderbilt Collection in New York. A peasant, with a bag of grain, is sowing seed on a hillside. A driver with oxen is seen at the end of the furrow.

SPHINX, THE. A colossal piece of carving at Gizeh of the head of the Pharaoh Khafra with the body of a lion. The work is 172 feet long and 66 feet high. It seems to guard the graveyard of the ancient Memphis, and to be connected with the Pyramid of Khafra, and the Valley Temple connected with it.

SPINARIO, THE. A statue of a boy seated and engaged in pulling a thorn from his foot. The work probably comes from the transitional period of Greek art between 480 and 450 B. C. It is in the Palazzo dei Conservatori in Rome.

SPRING, ALLEGORY OF. Painted by Botticelli, and now in the Uffizi gallery at Florence. The theme is suggested by the classic poets Horace and Lucretius. The figure of *Spring* herself is at the right, blown along by the *West Wind*, and preceded by *Flora*, the Goddess of Flowers. *Venus* stands in the center typifying the fruitfulness of nature in the springtime. To the left are the *Three Graces* and *Mercury*. The spirit is not truly classic in spite of the subject, but has the yearning, melancholy, and mystic quality of Botticelli.

STAGS THICKET. Painted by Courbet, in the Louvre. A delightful forest scene with deer, rendered with great fidelity to nature.

STROGANOFF MADONNA. An ivory Byzantine Madonna and Child from the twelfth century, now in the Cleveland Art Museum. Dignity and feeling for the material are remarkable, and one gets the impression at once that the Madonna is the Queen of Heaven.

STUDIO, THE. Painted by Courbet and now in the Louvre. It is a scene of the painter in his studio surrounded by a group of friends and artists.

STUDY. A most attractive young lady with an open book before her. Painted by Fragonard with great dash and spirit and now in the Louvre in Paris.

SURRENDER OF BREDA:—LAS LANZAS. Painted by Velasquez in 1647 and now in the Prado at Madrid. It represents the surrender of Breda in 1625. Justin of Nassau surrenders the keys of the city to the courteous marquis of Spinola, the Spanish commander in the presence of the Spanish and Flemish armies. A fine composition is aided by the skillful variation of the lances.

SWING, THE. In the Wallace collection in London by Fragonard. A young lady is swinging and loses her slipper while a young man in the bushes in front of her looks on delightedly.

SYNDICS OF THE CLOTHMAKERS' GUILD. Painted by Rembrandt in 1661; in the Amsterdam Museum. Five syndics or managers of the Cloth Hall (Staalhof) are gathered around a table; one of the number is standing; all are dressed in black.

TAILOR, THE. Painted by Moroni, in the National Gallery in London. The work is a fine example of the silvery tonality of North Italian painting of the sixteenth century.

TEMERAIRE, THE FIGHTING. Painted by Turner in 1839; in the National Gallery in London. This ship was captured in 1798 from the French; she took part in the battle of Trafalgar in 1805, and was condemned in 1838. The picture shows her being towed to Rotherhithe to be broken up.

TEN NUDES, THE. An engraving by Antonio Pollaiuolo representing men fighting in various positions. Scientific knowledge of anatomy is evident.

THINKER, THE. A statue of a nude man, seated, resting his chin on his hand. By Rodin, in front of the Pantheon in Paris. The compact composition gives an impression of suppressed power.

TRANSFIGURATION, THE. Christ's appearance in glory to the disciples. The most famous is by Raphael in the Vatican. Begun in 1519, Raphael completed only the upper part before his death in 1520. Giulio Romano finished it from Raphael's designs. The picture was hung over Raphael's body at his funeral and carried in the procession to the Pantheon.

TRIBUTE MONEY, THE. The scene in *Matthew xxii, 19* and *Luke xx, 24*. Painted by Titian; in Dresden Gallery. The inquiring Pharisee holds the coin in his hand while Christ is speaking to him. Another distinguished version is the fresco in the Brancacci Chapel by Masaccio. His powerful, solid forms, aerial perspective, compact composition, and monumentality made the chapel a school for the later painters of the Renaissance.

TRIUMPH OF CAESAR. Painted by Andrea Mantegna in 1485–1492; in Hampton Court Palace, England. Nine pictures, each nine feet square, depict a grand triumphal procession of Roman soldiers, captives, and slaves preceding Caesar drawn in a chariot.

TRIUMPH OF DEATH. Painted in 1377 by a follower of the Lorenzetti brothers of the Sienese school. It is in the Campo Santo at Pisa. Three kings on horseback halt before three coffins containing the bodies of dead kings, while the Angel of Death descends with his scythe upon happy groups. Death and his victims are in the center. In the clouds are represented the souls of the blessed and the damned.

TWO NATURES OF MAN. A group by Barnard in 1894 illustrating the text, "I feel two natures struggling within me." It is in the Metropolitan Museum in New York. A victor bends over a prostrate vanquished foe, two figures being identical. Remarkable for its vigor and impressiveness.

UNKNOWN ROMAN. A terra cotta head of a Roman citizen of the last years of the Roman Republic in the first century B. C. The crows feet about the eyes, the wrinkles, the shape of the skull are all intensely interesting and realistic. It is in the Boston Museum of Fine Arts, and is one of the best classical works in this country.

URSULA, HISTORY OF ST. (1) Painted by Carpaccio in 1490–1495; in the Venice Academy. There are nine pictures. (2) Hans Memling, about 1486, painted the history on the shrine of St. Ursula in the Hospital of St. John at Bruges.

VAPHIO, GOLD CUPS FROM. A pair of gold cups found at Vaphio near Sparta, and now in the National Museum at Athens, are decorated with reliefs showing the favorite Cretan subjects of bulls. Their realism is remarkable as is the feeling for design and material.

VENUS. Painted by Velasquez, the nude goddess reclines on a couch, her back toward the spectator, looking at herself in a mirror held by Cupid. The graceful figure is beautifully constructed, and the texture of the flesh is perfectly suggested. It is in the National Gallery, London.

VENUS ANADYOMENE. Painted by Titian in 1523; in Bridgewater House in London. The goddess is standing knee-deep in the sea and is combing her tresses. A shell floats beside her upon the water.

VENUS OF MEDICI. A marble statue found in the ruins of the Portico of Octavia in Rome; placed in the Villa Medici at Rome; removed to the Tribune of the Uffizi in Florence. It is an undraped figure, the hands in front and the head turned to the left. A dolphin is beside her to indicate that she has just risen from the sea.

VOLTAIRE, SEATED. A portrait statue of the sage by Houdon in the Théâtre Français in Paris. The figure is robed like a classic character. A light smile playing over his lips indicates the witty syniciam of the man.

VULCAN, FORGE OF. Painted by Velasquez in 1629–1631; in the Madrid Museum. Vulcan and four Cyclops stop work to listen to Apollo, who stands at the left; an illuminated wreath crowns his head.

WASHINGTON, PORTRAIT OF. The features of the Father of his Country have naturally been per-

petuated by many artists. Two fine equestrian portraits by Brown in Union Square New York, and by Ball in the Public Gardens in Boston show him as a General at the head of an army. Of the others, the fine bust by Houdon and the seated, half nude, colossal figure by Greenough are the most famous, though the latter is dull and somewhat ridiculous. In paint there are two fine portraits by Stuart, the Boston Athenaeum and the Bibb-Channing heads, both painted from life. He has also been painted by a number of other artists of the period.

WASHINGTON, APOTHEOSIS OF. Painted by Brumidi on the canopy of the rotunda of the Capitol at Washington. The first frescoes done in the United States. Washington sits in the center; the goddess of Liberty on his right and Victory on his left. The 13 original states are represented by female figures encircling the group. The *Fall of Tyranny, Agriculture, Mechanics, Commerce, Marine,* and *Arts and Sciences* are grouped in the border.

WASHINGTON CROSSING THE DELAWARE. A much reproduced painting in the Metropolitan Museum in New York by Emmanuel Leutze. Typical of the work of artists trained in the German school of Dusseldorf. Washington stands in a boat, which is slowly being rowed between the cakes of floating ice.

WASHINGTON, RESIGNATION OF. Painted by John Trumbull in 1827; in the rotunda of the Capitol at Washington. Washington is resigning his position as commander in chief of the Continental army at Annapolis (December 23, 1783). Yale University has the original study of this work.

WHITE CAPTIVE, THE. A marble statue by Erastus D. Palmer in 1858; now in the Metropolitan Art Museum at New York. In refinement, delicacy, and grace it is by far the best American work up to that time.

WINGED BULLS. Figures with human heads, a bull's body, wings, and lion's feet, regularly were used to flank the entrances of Assyrian palaces. Since these works would be seen from the front as well as from the sides two legs were represented in front view as though the animal were standing, and four in side view as though walking, making five legs in all. A fine example may be seen in the British Museum from the palace of Ashur-Nazir-Pal. (885–860 B. C.)

WOUNDED LIONESS. The slab from the palace of Ashur-Bani-Pal (668–626 B. C.) now in the British Museum, depicts a lioness, transfixed by three arrows, her hind legs paralyzed, dragging herself along as though supported simply by courage. The spirited rendering makes this one of the best of Assyrian reliefs.

YOUNG WOMAN AT HER TOILET. A young woman standing before a mirror adjusts a string of pearls around her neck. Painted by Vermeer, in the Kaiser Friederick's Museum at Berlin. The domestic incident with its refined appreciation of womanhood is typical of Vermeer.

ZENOBIA. A statue by Harriet Hosmer; in the Metropolitan Museum of Art, New York City. It represents Zenobia, queen of Palmyra, led captive in chains through the streets of Rome. Her haughty mein and native pride are well portrayed.

ZUCCONE, LO. A nickname for a statue of some biblical character with a bald head. The name means pumpkin-head. The work, carved by Donatello, on the campanile of the Cathedral of Florence, illustrates the artist's interest in realism.

DICTIONARY OF ART TERMS

ABACUS (*ăb'ȧ-kus*). The uppermost member of a capital affording support to the architrave.

ABBEY. A building annexed to or adjacent to a convent or monastery, and the whole combining a series of buildings for the accommodation of a fraternity under ecclesiastical government.

ABSIDIOLE (*ăb-sĭd'i-ōle*). A small, apse-like structure frequently used as a chapel.

ABUTMENT (*ȧ-bŭt'mĕnt*). Solid masonry set against a structure to resist a tendency to spread, generally caused by an arch. The supports which connect the bridge with the bank of a river are called abutments.

ACADEMY. In antiquity, a building in one of the suburbs of Athens, where Plato and other philosophers assembled.

ACANTHUS (*ȧ-kăn'thŭs*). An ornament of Greek origin representing in conventional form the leaf of the Acanthus Spinosus was used in the lower portions of the Corinthian capital. The Romans preferred the Acanthus Mollis.

ACCESSORIES (*ăk-sĕs'ŏ-rĭz*). In painting, secondary objects to the principal one in a picture, introduced as explanatory or illustrative of the scene; sometimes they are considered as solely contributory to the general effect and harmony of the work.

ACROPOLIS (*ȧ-krŏp'ŏ-lĭs*). The upper town or citadel of a Greek city, usually erected upon some natural elevation. The most famous is at Athens, on which stood the Parthenon, the Erechtheum, the Propylae, and the Temple of Nike Apteros.

ACROTERIA [pl.], **ACROTERIUM** [sing.] (*ăk-rŏ-tē'rĭ-ŭm*). Decorations on the angles of the pediments.

ACTION. In painting or sculpture, the posture or attitude which is expressive of passion or muscular energy.

ADOBE (*ȧ-dō'bē*). Bricks made of clay and straw, and dried in the sun. They were used in Egypt and other hot countries. The Moors from Africa, introduced them into Spain. In Mexico and the southwestern United States, the name applies equally to the bricks, clay, and the structures made of these materials.

AERIAL PERSPECTIVE. The relative apparent recession of objects from the foreground, owing to the quantity of air interposed between them and the spectator.

AESTHETICS. The power of perception by means of the senses; the word implies the perception and the study of those qualities which constitute the beautiful and artistic.

AGORA (*ăg'ŏ-rȧ*). A Greek public square or market place.

AISLES. Lateral divisions parellel with the nave in a basilica or church.

ALCOVE. A recess in a chamber, or a recess separated from other parts of the room by columns, antae, or balusters.

ALTAR. An elevated table of stone, marble or wood, dedicated to the ceremonies of religious worship.

ALTAR-PIECE. The ornamental sculpture or painting behind the altar in a Christian church.

ALTO-RELIEVO. High-relief.

AMBO (*ăm'bo*). A pulpit, especially that found in basilican churches.

AMBULATORY (*ăm'bû-lȧ-tŏ-rĭ*). A passageway in a building, especially the passageway around the apse.

AMPHIPROSTYLE. A temple with a freestanding portico at both ends.

AMPITHEATER. A building for gladiatorial and other shows, generally elliptical in form.

AMPHORA (*ăm'fŏ-rȧ*). A two-handled Greek vase.

ANCON (*ăn'kŏn*). A console or ornament cut on the keystone of an arch.

ANNULAR VAULT. A vaulted roof supported on circular walls.

ANNULATED COLUMNS. Those clustered together or joined by rings or bands.

ANNULET (*ăn'û-lĕt*). A small flat fillet encircling a column. It is repeated several times under the ovolo or echinus of a Doric Capital.

ANTA. A pilaster terminating the side wall of a Greek temple, with base and capital differing from those of adjacent columns.

ANTEFIXAE. Decorated blocks, fixed vertically at regular intervals along the lower edge of a roof, to cover the ends of tiles.

ANTHEMION (*ăn-thē'mĭ-ŏn*). A term given to honeysuckle or palmette ornament of several varieties.

ANTIQUE. Originally used in the Renaissance to mean Greek and Roman works of Art, but at present it includes all objects of aesthetic value having been made at least one hundred years ago.

APPLIQUE. A general term for ornaments which are let into or fixed on to the surface of an object.

APSE. The circular or multiangular termination of a church sanctuary.

AQUA FORTIS (*ā'kwȧ fôr-tĭs*). Literally, strong water—nitric acid.

AQUATINT (*ā'kwȧ-tĭnt*). A mode of etching by which an effect similar to an Indian-ink drawing is produced.

AQUEDUCT. A conduit for water; a construction of stone or timber, built on uneven ground to preserve the level of water, and convey it by a canal from one place to another.

ARABESQUE. Generally applied to a style of ornament for pilasters, friezes, consisting generally of scrolls of flowers, foliage, and fruits. The ornaments painted by Raphael in the Vatican are among the finest examples of arabesque painting.

ARCADE. A series of recesses with arched ceilings or soffits; a covered passage; a vaulted avenue affording shade from the sun and shelter from the rain.

ARCH. A structure of wedge-shaped blocks over an opening, so disposed as to hold together when supported only from the sides.

ARCHAIC (*ăr-kā'ĭc*). Pertaining to or having the character of extremely early and primitive work.

ARCHITECTURE. The art and process of building skillfully.

ARCHITRAVE. The portion of the entablature resting on the columns and immediately below the frieze. The moldings round a door are termed the architrave moldings.

ARCHIVOLT. A molded band carried around a curved opening.

ARMATURE. Metal bars used for strengthening and sustaining.

ARRAS (*ăr'ăs*). Tapestry hanging for rooms, first made at Arras in France in the fourteenth century.

ARRIS. The sharp edge formed by the meeting of two surfaces.

ASHLAR. Squared and finished building stone.

ASTRAGAL. A small semicircular molding, often ornamented with a bead or reel.

ATELIER. An artist's workshop.

ATLANTES (*ăt-lăn'tēz*). Figures of men used as supports or apparent supports.

ATRIUM (*ā'trĭ-ŭm*). In Roman architecture, the outer or entrance court surrounded by a roof but open to the sky in the center. In Early Christian and later architecture, the open space before the entrance.

ATTIC. A pedestal-like feature or story above the cornice of a building.

ATTIC BASE. A molded column base consisting of two convex moldings or toruses, with a hollow or scotia between.

AZURE. A fine blue tint suggesting the color of the sky.

BACCHANTES (*bă-kăn'tēz*). The female followers of Bacchus, the wine god.

BACKGROUND. In painting it is the space behind the subject.

BALANCE. Balance consists of the nice adjustment of line, form, tone, color, and plane.

BALCONY. A projection in the front of a building supported by consoles or columns. Sometimes applied to the overhanging section of the interior of a theater.

BALDACCHINO (*bȧl-dȧ-kē'nō*). The Italian word for canopy.

BAMBINO (*bäm-bē'nō*). In Italian, a child or baby.

BAPTISTRY. A place where the holy rite of baptism is performed. In ancient times it was a circular or polygonal building apart from the church.

BARBICAN. A fort at the entrance of a bridge or the outlet of a city.

BAROQUE (*bȧ-rōk'*). Florid and free ornamentation used in the seventeenth century.

BAR TRACERY. Tracery composed of thin bars of stone, joined together.

BARREL VAULT. A vault of semi-cylindrical form.

BASE. The lower portion of any structure or architectural feature.

BASILICA (*bȧ-sĭl'ĭ-kȧ*). A hall or church emphasizing the long axis.

BAS-RELIEF (*bä-rē-lēf'*). Sculpture in low relief.

BASTION (*băs'chŭn*). A projecting polygonal buttress on a fortification.

BATTER. A term applied to a wall with an inclined face.

BATTLEMENT. An indented parapet behind which archers could shelter themselves.

BAYS. Compartments into which the nave or roof of a building is divided. The term is also used for projecting windows.

BEAD. A small cylindrical molding often carved with an ornament resembling a string of beads.

BEAM. A horizontal piece of iron or timber, used to resist a force or weight, as a tie-beam where it acts as a string or chain, by its tension; as a collar-beam where it acts by compression.

BEAUTY. Is the effect produced by the proper relationship of magnitude and strength, order and harmony, richness and simplicity.

BELFRY. A term generally applied to the upper room in a tower in which the bells are hung, and often to the tower itself.

BEMA (*bē'mȧ*). The sanctuary, presbytery or chancel of a church reserved for the clergy. In Greek the raised platform from which the orators spoke.

BILLET. A Norman molding of short cylinders or square pieces at regular intervals.

BITING IN. The action of acid upon metal in etching and engraving.

BLIND ARCADE. An arcade applied to the face of the wall so that no actual openings appear.

BODY COLOR. Opaque water color.

BOSS. A projecting ornament at the intersection of the ribs of ceilings, whether vaulted or flat.

BOULLE. A marquetry consisting of a design sawed out of a thin plate of brass or other metal and inlaid into a veneer of tortoise shell, ivory, wood, etc. When the tortoise-shell predominates and forms the groundwork, it is called "première partie"; when the brass predominates, it is known as "contre partie."

BOURSE (*bōōrs*). A public edifice for the assembly of merchants to transact business, an exchange.

BRACKET. A projecting member to support a weight.

BREADTH. A quality of grandeur or largeness not limited by the size of the work.

BROACH SPIRE. An octagonal spire rising without a parapet above a tower, with pyramidal forms at the angles of tower, as in Early English churches.

BROKEN PEDIMENT. A pediment in which the raking cornice is broken through.

BURIN. An instrument for engraving on metal.

BURNISHER. A tool used for polishing a rough surface.

BUST. In sculpture, the head, neck and breast of a human figure.

BUTTRESS. A mass of masonry built against a wall to resist the pressure of an arch or vault.

BYZANTINE ARCHITECTURE (*bĭ-zăn'tĭn*). The style evolved at Constantinople (Byzantium) in the fifth century A. D., which is still the style of the Greek church.

CADUCEUS (*kȧ-dū'sē-ŭs*). A wand of laurel or olive on which two snakes are intertwined; the emblem of Hermes.

CALDARIUM (*kăl-dâ'rĭ-ŭm*). The hot chamber in a Roman bath.

CAMEO. Gems cut in relief are called cameos, while those hollowed out or depressed are called intaglios.

CAMPANILE (*kăm-pä-nē'lā*). In Italian, a bell tower, engaged or free-standing.

CANON (*kăn'ŭn*). Signifies an artistic rule or law.

CANOPY. A covering over a niche or tomb.

CAPITAL. The crowning feature of a column or pilaster.

CARICATURE. A representation in which the peculiarities of a person or of an object are so far exaggerated as to produce a grotesque effect.

CARRARA MARBLE (*kä-rä'rä*). A species of white marble which takes its name from Carrara in Italy and is distinguished from the Parian or statuary marble by being harder and duller.

CARTOON. A drawing made on paper of the exact pattern of a composition intended to be executed either in tapestry, mosaic, glass, or paint, i.e. Raphael's drawing in South Kensington Museum.

CARTOUCH OR CARTOUCHE (*kär-tōōsh'*). A carved ornament in the form of a scroll unrolled, forming a field for an inscription or design.

CARYATID (*kăr-ĭ-ăt'ĭd*). Examples: The most noble in the ruins of the Erechtheum, Athens, and in a hall of the Louvre, Paris, 16th century.

CATACOMBS. Underground burial places. The most famous are those at Rome in which the Early Christians held services and buried their dead, and where Early Christian art was born.

CATHEDRA (*kăth'ē-drȧ*). The bishop's chair in the Early Christian church.

CAVETTO (*kä-vĕt'tō*). Concave molding.

CAVO-RELIEVO (*kä-vō-rē-lyā'vō*). An Egyptian style of sculpture in which the highest relief is on a level with the surface of the stone, the rounded sides of the figures being cut into the material.

CELLA. The principal chamber of a temple.

CENOTAPH (*sĕn'ô-tȧf*). A sepulchral monument to a person buried elsewhere.

CENTAUR (*sĕn'tôr*). In ancient mythology, a being represented as half man, half horse.

CENTERING. Temporary supports, principally of timber, placed and affixed under vaults and arches to sustain them while they are in course of building.

CERAMIC. The ceramic art is one of making objects in different clays, and of decorating them by means of painting or modelling, or both.

CHAMFER (*chăm'fĕr*). An edge or arris, taken off equally on the two sides which form it, leaves what is called a chamfer, or a chamfered edge. If the arris be taken off more on one side than the other, it is said to be splayed or bevelled.

CHANCEL. The portion of a church in the east end, railed, and set apart for the use of the clergy.

CHAPEL. A small building attached to various parts of large churches or cathedrals. Sometimes a small church.

CHARACTER. In art—the expression means a faithful adherence to the essential peculiarities of objects represented.

CHASING. The art of cutting or chasing metal with a graver.

CHEVET (*shĕ-vĕ'*). A term applied to the complicated east end of the French cathedral.

CHEVRON (*shev'rŭn*). A zigzag ornamental molding frequently used in Norman architecture.

CHIAROSCURO (*kyä-rô-skōō'rō*). The effect produced by light and shade. Its chief exponent was Corregio (School of Parma, 1494–1534).

CHOIR. The arm of the cross between the transept and the apse.

CHORAGIC MONUMENTS (*kō-răj'ĭk*). Small pedestals or shrines erected by the winner of a choral contest to display the tripod which was his prize.

CHROMA (*krō'mȧ*). Chroma is the strength of a color.

CHRYSELEPHANTINE (*krĭs-ĕl-ē-făn'tĭn*). A term applied to works of sculpture executed in ivory, gold, and other precious metals.

CIBORIUM (*sĭ-bō'rĭ-ŭm*). A canopy over an altar supported by columns.

CINQUECENTO (*chĕn-kwȧ-chăn'tō*). The Italian word for the Sixteenth century.

CINQUEFOIL (*sĭnk'foil*). In tracery an arrangement of five foils terminating in cusps.

CLASSIC ORDERS OF ARCHITECTURE: The *Grecian:* Doric, Ionic, and Corinthian; and the *Roman:* Tuscan, Doric, Ionic, Corinthian, and Composite orders.

CLEAR-STORY. A part of a building which rises above the adjacent roofs, permitting it to be pierced with window openings.

CLOISONNE (*klwä-zô-nā'*). Cloisonné is obtained by dividing a metal surface by means of wire welded on to the metal plate. In the hollows formed, enamel in colored powder is deposited, then fired.

CLOISTER. A court surrounded by an ambulatory, usually arcaded.

CLOISTER VAULT. A square or polygonal dome.

CLUSTERED COLUMN. A pier formed by a number of shafts clustered together, either united or separate.

COFFER. A sunken panel or compartment in a ceiling, vault, or soffit.

COLONNADE. A series or range of columns, usually connected by lintels.

COLONNETTE. A diminutive column.

COLOR, COMPLEMENTARY. Those pairs of colors which when mixed produce white or grey light; red and green-blue; yellow and indigo blue; green-yellow and violet.

COLOR, LOCAL. Is the real fundamental color of an object, considered apart from all accidental variations of light and reflection.

COLOR, PRIMARY. Primary colors are colored pigment which cannot be compounded by mixture of other colors; red, yellow, and blue.

COLOR, RELATIVE. Colors which blend easily and produce harmonious tones.

COLORS, SECONDARY. Three colors, each produced by mixing two others in equal proportions.

Orange, a mixture of red and yellow; green, of blue and yellow; purple, of red and blue.

COLOR, SYMBOLIC. In the works of Early Christian painters, certain colors symbolized or were exclusively associated with certain persons or subjects. For instance, *white* was the symbol of light, purity, and faith, while *black* suggested mourning, wickedness, and death.

COLORS, TERTIARY (*tûr'shĭ-ā-rĭ*). Colors are called tertiary when they are produced by the mixture of a primary and secondary color, as olive, citrine, and russet.

COLORS, TRANSPARENT, OPAQUE. Are terms applied to such colors as will transmit and such as will only reflect light.

COLOR, WARM. Is produced when tones of red or yellow predominate. Blues and low toned violets are, on the other hand, cool colors.

COLOSSUS (*kŏ-lŏs'ŭs*). A statue of gigantic dimensions, such as the Colossus at Rhodes.

COLUMN. A circular supporting member, usually with a base and capital.

COMPOSITE. An order employed by the Romans, with a capital composed of the upper part of the Ionic, and the lower part of the Corinthian.

COMPOSITION. Is the proper distribution of the different elements in a work of art which results in unity.

CONSOLE. A projecting ornament in wood or stone, used as a bracket.

CONTINUOUS IMPOSTS. Are the moldings of an arch which are continued without interruption down to the ground or base.

CONTOUR. Is the term applied to the outline of an object.

CONTRAST. Contrast, both in line, form, and color is the effect produced by the juxtaposition of two opposing elements.

CORBEL. A projecting bracket supporting a pier, cornice, or column.

CORBEL TABLE. A projecting course of masonry carried on corbels, often connected by arches.

CORBELED ARCH. An arch built up of horizontal courses, each projecting over the one below.

CORINTHIAN. The third Order of Greek Architecture.

CORNICE. The upper portion of the entablature or any crowning projection.

CORONA. A molding forming part of a cornice with lower part grooved to form a dripstone.

COUNTER-PROOF. An impression of an engraving printed from a wet proof.

COURSE. One range, or stratum, of bricks, stones, or other material in the construction of a wall.

CREST. A running ornament, more or less incised and perforated, which is placed on the ridge of roofs.

CROCKET. A projecting piece of carving, usually foliate, commonly used to decorate the edge of a gable or the sloping ridges of a spire in Gothic Architecture.

CROMLECH (*krŏm'lĕk*). A type of prehistoric monument composed of a circle of stones.

CROSS-HATCH. To draw lines crossing other lines.

CROSSING. The space in a cruciform church at the intersection of nave and transepts.

CRYPT. A subterranean chapel beneath a church.

CUPOLA. A dome or lantern.

CUSP. Pointed foliations in architectural tracery.

CYCLOPEAN (*sī-klō-pē'ăn*). A term applied to early masonry of very large blocks, unhewn or irregular.

CYMA (*sī'mâ*). A molding having a reverse curve. In the cyma recta the concave portion is uppermost; in the cyma reversa, the convex is uppermost.

CYMATIUM (*sĭ-mā'shĭ-ŭm*). The crowning member of a cornice.

DABBER. An instrument made of a solid mass of wool encased in leather, fastened to a wooden handle. It is used in the process of etching to distribute the ground over the plate of metal.

DADO. A continuous pedestal or wainscoting around the base of a wall.

DAMASCENING. Metal ornamented by inlaying another metal.

DECASTYLE. A temple with a portico consisting of ten columns in front.

DECORATED. The second of the pointed or Gothic styles of architecture in England.

DENTILS. Small projecting blocks which support the cornice.

DIAPER. A term applied to any small pattern, such as lozenges or squares, repeated continuously over a surface.

DIE. A metal block cut in intaglio.

DIPTERAL (*dĭp'tĕr-ăl*). A temple having a double range of columns on each of its sides.

DISTEMPER. The preparation of colors mixed with glutinous substances rather than oil, used exclusively by artists before 1410.

DODECASTYLE (*dō'dĕc-a-style*). A building having twelve columns in front.

DOG-TOOTH. An ornament resembling a row of teeth, especially occurring in Early English Buildings.

DOLMEN. A pair of stone blocks with a covering slab, used for prehistoric monuments.

DOME. A hemispheral vault.

DOMED BASILICA. The term applied to the form of basilica, especially in the East, when one or more bays are covered with a dome.

DONJON (*dŭn'jŭn*). A tower-like structure usually free-standing, the strongest part of the European medieval castle.

DORIC. The first and simplest order of Greek Architecture.

DORMER. A vertical window projecting from the slant of a roof.

DOSSERET. A deep block sometimes placed above a Byzantine capital.

DRIP. Any projection used to throw off water and thereby protect a surface.

DRY-POINT. A drawing made in the metal by varied pressure of a steel needle.

EARLY ENGLISH. The first of three divisions of English Gothic architecture.

ECHINUS (*ĕ-kī'nŭs*). The convex member of the capital, supporting the abacus.

EGG AND DART. An ovolo decorated by oval projections, each one surrounded by a groove and a raised rim; between each pair of rims is inserted a sharp pointed member called a dart.

ELEVATION. The vertical plan of a building.

ELIZABETHAN. The style developed during the reign of the Tudors in England.

ENAMEL. A semi-opaque, vitrified material, which is melted and applied to various metals, such as gold, silver, and copper; also applied to the opaque glaze on pottery.

ENAMEL, TRANSLUCENT. Are small enamels on gold or silver. Only six colors are found in translucent enamels; blue, green, grey, tan, purple, and black.

ENCAUSTIC. A method of painting with colors mixed in melted wax which is kept hot during the whole process. The term also applies to a preparation laid on marble or plaster to protect it from moisture.

ENGAGED COLUMN. A column-like member projecting from a wall and frequently actually a part of the wall masonry.

ENGRAVING. A process in which the lines of the design are incised on a plate of metal, and these being filled with ink, a sheet of paper laid on the plate, and the whole submitted to the press, the result is called a proof.

ENTABLATURE. The upper part of an Order of architecture, comprising architrave, frieze, and cornice.

ENTASIS (*ĕn'tà-sĭs*). The swelling of the shaft of a column.

ESCUTCHEON (*ĕs-kŭch'ŭn*). A shield charged with armorial bearings.

ETCHING. Engraving by the action of acid on a metal plate covered with a wax ground, through which lines have been scratched by the etching needle.

EUSTYLE (*ū'stīl*). Intercolumination of two diameters and a quarter of the column considered by the Greeks to be the most perfect.

EXEDRA (*ĕk'sē-drà*). In classical architecture a recess or alcove with raised seats; in Christian architecture an apse or niche.

EXPRESSION. Is the result of good interpretation of the essential character in the subject or objects.

EXTRADOS (*ĕks-trā'dŏs*). The outer curve of an arch.

FACADE (*fà-säd'*). The face or front of a building.

FAN TRACERY. The decorative tracery on the surface of fan vaulting.

FAN VAULT. A system of vaulting peculiar to the Perpendicular period, in which all ribs diverge, and resemble the framework of a fan.

FASCIA (*făsh'ĭ-à*). A long flat band or belt.

FENESTRATION (*fĕn-ĕs-trā'shŭn*). The disposition of windows in a building.

FILIGREE. Goldsmith's work consisting of threads of metal intertwined and soldered.

FILLET. A small flat band between moldings.

FINIAL (*fĭn'ĭ-ăl*). An ornament of carved work representing foliages.

FITNESS. Fitness is the perfect adaptation both to function and to means of expression.

FLAMBOYANT. A florid style of French pointed architecture peculiar to the Fifteenth century.

FLECHE (*flĕsh*). A term applied to a slender spire rising from a roof.

FLUTING (*flōōt'ĭng*). The vertical channelling on the shaft of a column or pilaster.

FLYING BUTTRESS. An arch starting from a detached pier and abutting against a wall to take the thrust of the vaulting.

FOIL. Each of the small arc openings in Gothic tracery separated by cusps.

FONT. A basin in which the water for the administration of baptism is contained.

FORESHORTENING. The art of representing objects on a flat surface as they appear to the eye in perspective.

FORM. Form is the ensemble of appearing surfaces which define objects.

FORUM. The market place of a Roman city.

FOYER. A lobby or saloon for promenade.

FRESCO-PAINTING. Painting on freshly applied wet plaster.

FRET. An angular, interlaced architectural ornament.

FRIEZE. (1) The middle division of an entablature which lies between the architecture and cornice. (2) Any horizontal sculptured band.

FRONTALITY. The placing of a figure so that a plumb-line dropped from the center of the forehead would divide it into two equal parts.

GABLE. The triangular portion of a wall, between the enclosing lines of a sloping roof.

GARGOYLE (*gär'goil*). A water spout, usually grotesquely carved, to throw water from the roof.

GENRE (*zhän'r'*). Scenes from domestic life.

GESSO (*jĕs'ō*). In Italian art, hard plaster used for casts from works of art, and also as a ground for mural painting.

GIGANTOMACHY (*jī-găn-tŏm'ă-kĭ*). A group or composition representing the mythical combat between the gods and the giants.

GLAZING. In oil painting, the application of a thin layer of transparent pigment used to modify color tone. vitreous covering over the surface.

GOTHIC. The name generally given to the pointed style prevalent in Western Europe from the Thirteenth to the Fifteenth century.

GOUACHE (*gwăsh*). Opaque watercolor pigment.

GRAPHIC ART. Is drawing, painting, engraving, or other forms of representation on a flat surface.

GRAVER. A steel instrument with a sharp point at one end. The graver is used to cut furrows into metal.

GREEK CROSS. A cross of four equal arms meeting at right angles.

GRISAILLE (*grĭ-zāl'*). A painting in which only black, white, and greys are used.

GROIN. The curved arris formed by the intersection of vaulting surfaces.

GROTESQUES. Figures of a monstrous, comic, or obscene character.

GROUP. Two or more figures or objects so placed and related as to form a unit. The groups in painting or sculpture should present well-balanced masses.

GROUPING. The arrangement of subject matter.

GUILLOCHE (*gĭ-lōsh'*). A circular interlaced ornament like network, frequently used to ornament the "Torus" molding.

GUTTAE (*gŭt'ē*). Small cones under the triglyphs and mutules of the Doric entablature.

GYMNASIUM. A large building used by the Greeks in which gymnastics were taught and practised.

HALF-TIMBER. A type of construction consisting of a framework of timber with a filling of other material.

HALF-TONE. A tone intermediate between two sharply-marked tones of different value.

HARMONY. Harmony is the quality in a work of art which blends into one force its different parts.

HARPIES. Winged monsters, daughters of Neptune and Earth.

HATCHING. Shading by crossed lines.

HELIX (*hē'lĭks*). A small volute like the tendril of a vine placed under the Corinthian Order.

HERM. A head or bust supported on a quadrangular base corresponding roughly in mass to the absent body.

HEXASTYLE. Having six columns across the front.

HIPPODROME. In Greek architecture, a place in which horses and chariot races were run.

HUE. A compound color in which one of the primaries predominates.

HYPOSTYLE (*hĭp'ō-stīl*). A hall having its ceiling supported by columns.

IDEAL. Any work of art which represents a high mental concept of the concrete.

ILLUSIONISM. The attempt in Art to suggest depth.

IMPASTO (*ĭm-pās'tō*). The thickness of the body of pigment laid on a painting.

IMPOST. A horizontal member at the springing of an arch or vault.

IMPRESSION. A print struck off from an engraved or etched plate.

IN ANTIS. A term applied to columns embraced between the ends of two walls or ante.

INLAY. A term applied to the piece of wood, metal, or ivory inserted to produce a design.

INTAGLIO (*ĭn-tāl'yō*). A material in which the engraved subject is sunk beneath the surface, and thus distinguished from a cameo.

INTERCOLUMNIATION. The space or distance between two columns of a colonnade.

INTRADOS (*ĭn-trā'dŏs*). The inner face of an arch or vault.

IONIC. The second order of Greek Architecture.

JAMBS. The sides of doors and windows.

KEYSTONE. The central wedge-shaped stone of an arch.

KLAFT. A royal Egyptian headdress forming a kind of hood and terminating in two flaps, which fall over the breast.

LANCET. An acutely pointed arch.

LANTERN. A tower above the roof of a building having windows all around it.

LECTERN. The desk or stand in a church on which the larger books are placed. Lecterns are made of stone, marble, wood, and brass.

LIGHTS. The open space between the stone mullions of a window. Thus a group of three narrow windows would be termed a lancet window of three *lights*.

LINE. A mark drawn by a pen, pencil, chalk, graving tool, etc. to indicate direction or form.

LINE OF BEAUTY. A curve like an elongated S.

LINTEL. A horizontal beam spanning an opening.

LITHOGRAPH. A drawing made or transferred on stone or treated zinc with an oily ink or crayon.

LOGGIA (*lŏj'ă*). A shelter behind an open arcade or colonnade.

LOMBARD ARCHITECTURE. A style invented by the Lombards in the Northern part of Italy in the 7th century.

LOTUS. A water lily. In Egypt and India held sacred.

LOUIS QUATORZE. A style developed towards the close of the 17th century in France.

LUNETTE. The space bounded by the soffit of the arch and its springing.

MANSARD ROOF. A roof having on all sides two slopes, the lower one being steeper than the upper one.

MARQUETRY (*mär'kĕt-rĭ*). Checquered or inlaid work, a sort of veneering, representing flowers, birds, and other figures.

MATT. Dull, lustreless, applying to a surface or color having neither brilliancy nor polish.

MAUSOLEUM (*mŏ'so-lē'um*). A large and elaborate tomb.

MEDALLION (*mĕ-dăl'yŭn*). (1) A medal of a larger size than the ordinary coinage. (2) In architecture, a circular or oval tablet on the face of a building.

MENHIR (*mĕn'hēr*). A single standing pillar of stone, used for prehistoric monument.

METOPE (*mĕt'ō-pē*). A square slab, sculptured or plain, between the triglyphs in the Doric frieze.

MEZZANINE. A low story between two lofty ones.

MEZZO-RELIEVO. Sculpture in half-relief.

MEZZOTINT. A kind of engraving nearly resembling painting, effected by scraping and burnishing copper whose surface has been prepared with innumerable perforations.

MIDDLE DISTANCE. In a landscape: Between the foreground and the background.

MIDDLE TINT. A color intermediate in value between the brightly lighted part of a picture and the part placed in shadow.

MISERICORD (*mĭz-ĕr-ĭ-kôrd'*). "A shelving projection on the under side of a hinged seat in a choir-stall, so arranged that when turned up, it gives support to one standing in the stall."

MODULE (*mŏd'ūl*). A unit or common divisor of the dimensions of a building.
MONOCHROME (*mŏn'ō-krōm*). A painting executed in tints of one color only.
MONOLITH (*mŏn'ō-lĭth*). An object formed of a single block of stone.
MOORISH ARCHITECTURE. Arose at the beginning of the 7th century in the East, and in Spain, Sicily, and Byzantium in Europe.
MOSAIC. Decoration composed of tesserae or cubes of glass or marble, set in mortar, in geometric or pictorial designs.
MOSQUE (*mŏsk*). A Mohammedan place of worship.
MOLD. An imprint of an object in relief, by means of which a reproduction of the object may be obtained.
MULLION (*mŭl'yŭn*). Vertical members dividing windows.
MURAL DECORATION. The decoration on wall surfaces.
MUTULE (*mū'tūl*). A projecting block on the soffit of a Doric cornice.

NAOS (*nā'ŏs*). The essential or principal chamber of a Greek temple; the cella.
NARTHEX. A long arcaded porch forming an entrance into a Christian basilican church.
NAVE (*nāv*). The middle part or body of a church from the choir to principal entrance between the aisles.
NECK-MOLDINGS. The moldings at the bottom of the capital.
NEUTRAL. A vague color which does not present any predominant tone.
NEWEL. The central shaft, round which wind the steps of a circular staircase. Also applied to a post into which the handrail is framed.
NICHE. A recess in a wall.
NIMBUS. A circular halo.
NORMAN. The Romanesque style of England and Normandy.

OBELISK. A tapering shaft of rectangular plan, generally with a pyramidal apex.
ODEON (*ō-dē'ŏn*). In Greek Architecture, a building for musical and oratorical contests.
OGEE (*ō-jē'*). A molding made up of a convex and concave curve. Also applied to an arch of similar shape.
OPISTHODOMOS (*ŏp-ĭs-thŏd'ō-mŏs*). An open vestibule at the rear of a temple cella.
OPUS ALEXANDRINUM. An elaborate geometrical mosaic of marble slabs and tesserae.
ORDER. In classical architecture, a recognized system of forms for the column and entablature.
ORIEL. A window corbelled out from the face of a wall.
OUTLINE. The representation of an imaginary line bounding the visible surfaces of objects.
OVOLO. A quarter-round, convex molding much used in classical architecture.

PAGODA. A sacred tower in the countries of the far east.
PALMATE (*păl'māt*). Having fanlike lobes or leaves, such as characterized the Greek anthemion or honeysuckle, and its derivations in architectural decoration.
PARALLELISM. Lines of like direction.
PARAPET. A breast wall placed at the edge of a platform, terrace, balcony, etc.
PASTEL. A process of painting, in which variously colored crayons are used.
PATINA (*păt'ĭ-nā*). The rust of antiquity found on bronzes and coins.
PEDIMENT. A low, triangular gable, bounded by a horizontal cornice and raking cornices.
PENDANT. A suspended ornament. The hanging pendants of the vaulted ceiling in King Henry VII's chapel at Westminster Abbey are remarkable.
PENDENTIVE. An inverted triangular portion of a concave vault placed upon a pier to support a section of the dome.
PENT-ROOF. A roof sloping only from one side.
PERIPTERAL (*pĕ-rĭp'tĕr-ăl*). A term applied to an edifice surrounded by a range of columns.
PERISTYLE (*pĕr'ĭ-stīl*). A range of columns surrounding a court or temple.
PERPENDICULAR. A phase of English Gothic evolved from the Decorated style and prevalent during the fifteenth and sixteenth centuries.
PERSPECTIVE. The art of representing on a flat surface the appearance of objects from one given point of view.
PIAZZA. A square or open place surrounded by buildings.
PIER. A support, distinguished from a column by greater massiveness, and by shape other than circular.
PIETA (*pē-ā-tä'*). The Italian term for the supported dead Christ. Examples: Sculpture, Michaelangelo, Saint Peters' Rome; Paintings, Titian, in the Academy, Venice. Fra Angelico in Museum, San Marco, Florence. Carlo Crivelli, Metropolitan Museum, New York.
PIGMENTS. The colors used in painting.
PILASTER (*pĭ-lăs'tĕr*). A flat rectangular member, projecting slightly from the face of a wall, and having the members of a column.
PINNACLE. A small spire.
PITCH OF ROOF. The inclination of its surface to the horizon.
PLAN. The representation of the shape of a building showing the general distribution of its parts.
PLASTIC ART. Includes works produced by modelling or carving.
PLINTH. A rectangular block usually serving as a base.
POLYCHROME. That which is of several colors.
PORTICO. An open porch or vestibule having its roof supported by columns or piers.
PROFILE. The outline of a form or its section.
PRONAOS (*prō-nā'ŏs*). The portico situated in front of a temple.
PROPORTION. Proportion is the harmonious relation of the different parts of a composition.
PROPYLAEA (*prŏp-ĭ-lē'ä*). Gateway or entrance
PROSYTLE (*prō'stīl*). A term applied to a temple or pavilion having columns across the front only.
PURITY. A term which denotes correctness and precision in a work of Art.
PUTTO (*pŭ-tō'*). The Italian term for a nude child as an artistic motif.
PYLON. A monumental gateway to an Egyptian temple.

QUADRIGA (*kwŏd-rī'gä*). A four-horsed chariot.
QUATREFOIL. In tracery, a panel divided by cusps into four leaf-shaped openings.
QUATTROCENTO (*kwät"tro-chen'to*). The Italian word for the Fifteenth Century.
QUOINS (*kwoin*). The corners of brick or stone walls; when they stand out beyond the brickwork, they are called "rustic quoins."

RADIATION. Movement growing out of a central point.
REFECTORY. The dining-hall in a monastery, convent, or college.
REFLECTED LIGHTS. Are such lights as an object receives on the shadow side from its opposition to an illuminated object.
RELIEF. In painting, is the apparent projection of objects obtained by a gradation of tonal or color values.
RENAISSANCE. The term applied to the re-introduction of the Classic all over Europe in the Fifteenth and Sixteenth centuries.
RENDER. To render is to represent, express, or interpret by the means proper to any particular art.
REPLICA. Similar copies of art made from an original work.
REPOSE. A term applied to a work of art containing balance, harmony, and dignity.
REPOUSSE (*rē-pōō-sā'*). Metal work hammered out from behind into ornaments in *relief*.
REREDOS (*rēr'dŏs*). The screen, or ornamental work, rising behind the altar.
RETICULATED. Latticed like the meshes of a net.
RHYTHM. Rhythm is measured movement.
RIB. A projecting band on a ceiling vault, or elsewhere.
RIDGE. The upper angle of a roof; tiles called ridge-tiles are sometimes made very ornamental.
ROCOCO (*rō-kō'kō*). The style of Louis Quinze in which fantastic forms and objects are put together in rich profusion.
ROMANESQUE. Prevalent in Western Europe from the Ninth to the Twelfth Century.
ROOD. In medieval churches, a large crucifix at the entrance of the chancel, often supported on a beam or screen.
ROOD-LOFT. A loft or gallery, in a medieval church on which the rood was supported. It was commonly placed over the rood-screen, and from it the Gospel was read.
ROOD-SCREEN. A screen, open or partly closed, of wood, stone, or wrought iron erected in medieval churches between the nave and the choir or chancel supporting the rood in the centre.

ROSE WINDOW. A large circular window divided by mullions.

ROTUNDA. A name given to any building that is round both within and without. The Pantheon, Rome, and the Chapel of the Escurial are of this type.

RUSTICATED STONE. Stone masonry with roughened surfaces, and recessed joints.

SACRISTY. A room attached to a church where the sacred vestments and the utensils belonging to the altars were placed: Termed also the sextry or vestry.

SARACENIC (*săr-â-sĕn'ĭk*). The Moorish style of architecture.

SARCOPHAGUS (*sär-kŏf'â-gŭs*). A stone coffin.

SATYRS. Greek deities of the wooded plains, as the Roman *fauns* were of the fields. They are usually represented with goat's legs and horns, and human bodies covered with short hair.

SCALE. The effect of size produced by the just relationship of the different elements in a work of art.

SCONCE (*skŏns*). Bracket projecting from the wall, supporting candlesticks, originated in the 15th century.

SCOTIA (*skō'shĭ-â*). A concave molding of circular section.

SCRAPER. An etcher's and engraver's tool for removing the rough edge produced on the metal by an incised line.

SCULPTURE. Is the art of carving wood or stone into images. To make a distinction between carving and sculpture, the former belongs exclusively to wood, and the latter to stone.

SECTION. A term used to express the representation of a building or solid cut by a vertical plane.

SEQUENCE. Orderly progression repeated.

SFUMATO (*sfōō-mä'tō*). A soft and vaporous quality in paintings.

SGRAFFIATO (*sgräf-fĭ'tō*). A method of painting on stucco, in which a ground of dark stucco is covered with a coat of a lighter color, and the design is formed by scraping this away for the darks.

SHADE. That part of a picture, drawing, or engraving representing objects which, not being struck with luminous rays, are relatively obscure.

SHADOW CAST. A shadow projected upon a surface by a lighted body.

SHAFT. The portion of a column between base and capital.

SIMPLICITY. A term dealing with the effect produced by the proper subordination of detail.

SOFFIT (*sŏf'ĭt*). The under side of an architectural member such as a lintel or arch.

SPAN. The distance between the supports of an arch, roof, or beam.

SPANDREL. The triangular space partly enclosed by the curves of an arch.

SPHINX. A figure with a human head on a lion's body.

SPIRE. A lofty, slender, generally octagonal member, used to crown a medieval tower.

SPLAY. A sloped surface, which makes an oblique angle with another.

STALLS. Divisions with fixed seats for the clergy and choir.

STATE. The condition of an engraved or etched plate before it is entirely finished.

STATUE EQUESTRIAN. A statue representing a person mounted on horseback.

STELA (*stē'lâ*). The Greek name for a slab of stone set on end to form a monument.

STENCILLING. A method of executing decorative paintings by putting color through the perforations of a firm material and onto the surface to be decorated.

STEREOBATE (*stĕr'ē-ō-bāt'*). The substructure of a Greek temple below the columns.

STILL LIFE. Representation of inanimate objects.

STILT. To raise the point of springing of an arch above the level of a capital or impost.

STOPPING OUT. When an etcher desires one portion of his plate to be more deeply bitten than another, he covers the finished parts with varnish to protect them from the acid before biting the deeper parts. This is called "stopping out."

STRING COURSE. A horizontal course of masonry, usually molded, marking an architectural subdivision of a building.

STUCCO. Plaster or cement used as a coating for walls.

STYLOBATE. The uppermost step of the stereobate or foundation on which the building immediately rests.

SYMBOL. A conventional representation of figures or objects which are the sign of an idea.

SYMMETRY. Symmetry is the harmony produced by the repetition of any form, line and color on its axis.

TAENIA (*tē'nĭ-â*). A band which separates the Doric frieze from the architrave.

TANAGRA (*tăn'â-grâ*) **FIGURES.** Terra-cotta figures made in ancient times at Tanagra in Basotia. The finest date from the fifth century B. C.

TASTE. The artistic faculty which selects materials and treatment best fitted for artistic expression.

TECHNIQUE. All those qualities of hand and eye which contribute to the executive excellence of a work of art.

TEMPERA. Tempera is a method of painting, in which dry colors are diluted in glue or size.

TERRA COTTA. All kinds of burned or baked clay.

TESSERAE (*tĕs'sĕ-rē*). Small cubes of marble or glass, used in the composition of designs in mosaic.

TETRA-STYLE. Having four columns.

TEXTURE. Denotes the quality of a surface.

THOLOS (*thō'los*). In Greek architecture, a circular structure or temple.

THRUST. The outward horizontal force exerted by an arch or vault.

TONALITY. A collection of tones subordinated to one dominant tone.

TONE. The variations produced by the introduction of white or black to color.

TORSO. The human trunk, not including extremities.

TORUS. A large convex molding used principally in the bases of columns.

TOUCH. The method in which the colors are laid on the surface of the canvas by the painter. We speak of a firm touch, a light touch, a square touch, or a want of touch.

TRABEATED ARCHITECTURE (*trā'bē-āt-ĕd*). A post and lintel architectural system.

TRACERY. The ornamental pattern-work in stone filling the upper part of a Gothic window.

TRANSEPT. A large division of a church lying at right angles to the long axis of the building.

TRANSOM. The horizontal cross bar in a window.

TRECENTO. (*trā-chĕn'tō*). The Italian word for the Fourteenth Century.

TREFOIL. An ornament of three foils.

TRIFORIUM. The second or middle story of a church.

TRIGLYPH (*trī'glĭf*). A projecting block in a Doric frieze marked by vertical grooves.

TRIPOD. Any utensil or article of furniture supported upon three feet.

TRIPTYCH (*trĭp'tĭk*). A form of pictures in three panels.

TRIUMPHAL ARCH. A monumental structure, with one or more arches, erected across a public road for a triumphal procession to pass under.

TROPHIES. Designs, often seen in the decorative work of interiors and in furniture in marquetry, representing groups of military arms and weapons, flags, etc. By extension the word is sometimes used in connection with other objects; thus groups of musical instruments are spoken of as musical trophies.

TUDOR ARCH. A four-centered, pointed arch, common in English Tudor Architecture.

TURRET. A small tower attached to and forming part of another tower, or placed at the angles of a church or public building, especially in the style of Tudor architecture.

TYMPANUM. The triangular space between the horizontal and sloping cornices. The name is also given to the space included between the lintel of a door and the arch over it.

TYPICAL. That which has the distinguishing characteristics of a type.

UNITY. The harmonious effect produced by the proper arrangement of parts.

VAULT. An arched ceiling or roof of stone.

VIBRATINUG. A term applied to a strongly marked nervous living effect of lines, forms, and colors obtained by the use of skillful contrasts.

VOLUTE. The characteristic ornaments and spiral marks of the Ionic capital formed by circumvolving spiral moldings are termed volutes. The small circle in which the spiral terminates is called the eye of the volute.

VOUSSOIR. (*vōō-swär'*). The wedge-shaped stones forming an arch or vault.

ZOOPHORUS or ZOPHORUS (*zō-ŏf'ō-rŭs*). (lit. bearing animals). A continous frieze decorated with figures of animals, conventional and real.

MUSIC

INTRODUCTION

Music lovers, everywhere, are awakening to the fact that, today, music has a greater mission in the world than merely to give sensuous pleasure. That it has great power to soothe and stimulate is being appreciated as never before.

Inasmuch as art music alone is considered in our references to music, it may be well to draw some line of demarcation between good music and sounds mislabeled music. Good music, called classic by many, is nothing more than permanent music. That is, it is of that quality which gives it long life. Popular music, to use a term generally applied to it, does not live long for the simple reason that it is not fit to. Usually cheap and trivial, it makes only a superficial appeal. In other words, even those who care for it are interested only a short time.

As for jazz, it may be well to catalogue it clearly for there is confusion regarding it and popular music generally. Jazz consists of unmusical, vulgar, even licentious sounds, played upon a few wind, string, and percussion instruments. It is based upon exaggerated rhythms, and the entire effect is that of raucousness and suggestiveness carried to a point of indecency. Many people include everything of that sort in their conception of popular music. That is why we hear jazz mentioned as being not all bad. What is really meant is that the best of popular music—the kind which has a catchy melody, clever rhythmic figuration, and a pleasing harmonic background, and very often taken from our better comic operas,—has its place. But such music should never be taken for jazz, which is said to have originated in the dives of the far south and west.

Most people who are interested in popular music respond to what is best in music, when given a chance. They are susceptible to the influence of good music, and require only opportunities to hear it frequently enough and with the proper interpretation. In short, these recruits from the ranks of popular music lovers are the potential devotees of tomorrow, for in due time, the deeper appeal of chamber music, symphony and miscellaneous concerts, and especially opera, will win them over to a higher aesthetic taste.

An influence upon the growth of appreciation for better music, which is very powerful, and should not be overlooked, is the influence our young folks are exercising on their parents and elders, because of their own increasing ability in public school music, school orchestras, bands, and choruses. Nor should we ignore the betterment being brought about by various music organizations of different character, which reach out in many directions.

In one sense it is perhaps true that, fundamentally, it is the business of music to give pleasure and enjoyment. It may also express the deepest feelings of heart and mind, however, through the proper use of its component factors, rhythm, melody, and harmony.

Rhythm is the division of time into groups of metrical units. A succession of tones, which express thought is called *melody*. Tones sounded together so as to make a combination pleasing to the ear constitute *harmony*. When two or more melodies are heard simultaneously, the effect produced is called *polyphony* or *counterpoint*. Although one element may at times be the preponderant expressional factor, it is practically impossible for rhythm, melody, and harmony to be dissociated in the making of music. An understanding of these fundamental facts is desirable in order that the following pages may be more clearly grasped.

Music may be characterized in four ways—As to:

1. **Nationality.**—By means of rhythms, melodies, folk-songs or dances, certain characteristics of countries or localities may be made manifest.

2. **Poetic Thought.**—When the composer expresses great ideals, states of emotions, (moods) aesthetic conceptions, poetic atmosphere, the type of music is said to be *pure* or *absolute music*. Since this type is made to conform strictly to the symmetrical ideas of form, it is also, at times, referred to as *formal music*.

3. **Descriptive Music.**—When music imitates the sounds or things of nature, relates a story, or, in general, follows a given program of thoughts, incidents or events, (sometimes because of the employments of a national idiom) it is usually called *program music*.

4. **Form.**—Music cannot meander on in meaningless disorder, but conforms to a definite pattern, created by the use of contrasted sections or parts. Simple forms are logical in songs, dances and shorter compositions (waltz, polka, minuet, songs without words, etc.), more complex forms are found in larger structures (sonatas, overtures, symphonies, etc.).

At least one of these characteristics is noticeable in all music. Form is always present in a musical composition; nationality is often reflected, poetic thought is easily distinguished when present. A definite title for an instrumental composition generally suggests a program. This use of superscriptures is most common in music written since the middle of the 19th century.

General History.

As an art music was an important factor in the world's civilization. It is an interesting fact that, although the oldest of the arts, it was the last to be developed culturally. This is perhaps due to the fact that a nation first becomes great through conquest and growth, then it gains influence politically and commercially. In due time the arts are developed. First, the visible arts, painting, architecture and sculpture, and lastly, music find their place in the intellectual scheme of things.

The growth of music may be divided into three periods of development:

1. **Music of Antiquity.**—A history of the scale and one part music (Assyrians, Hebrews, Egyptians, Chinese, Hindus, Greeks).

2. **Medieval Music.**—The music of the *Early Church*, the growth of *Secular Music, The Schools of Counterpoint, The Rise of the Opera, The Rise of the Oratorio.*

3. **Modern Music.**—*The Classical School*, development of pure or absolute music. *Romantic*

School, Romance, having made its influence felt in the other arts, also impregnates music.

Extreme Program Music.—Realism, impressionism, a general defiance of traditions, including atonality and polytonality. (To be explained later.)

Music of Antiquity.

Assyrians, a warlike race, used instruments like military trumpets, and instruments of percussion, also some stringed instruments like the dulcimer.

Egyptians used lutes and lyres, and the popular flutes, single and double, but the national instrument was the harp, which was used in all sizes, up to the large temple harps of twenty-three strings. The Egyptians employed music in a social way as well as in their religious ceremonies.

Hebrews obtained both their musical knowledge and their instruments from Egypt and Babylon. Their music was prominent in their temple rites, for which they used large choirs of as many as 4,000 instruments and voices. It was antiphonal in character, that is, chanted by the leaders and choirs responsively. In 70 A.D. Jerusalem was destroyed by Titus, and all records of Hebrew music were lost. However, the old melodies were handed down from generation to generation, and have been preserved to this day, so that the Synagogal services, on high holidays, such as "Rosh Hashanah" (New Year's Day) and "Yom Kippur" (Day of Atonement) are conducted practically as they were thousands of years ago. The Shofar, one of the earliest instruments of the Hebrews, is still used in orthodox temples to assemble the congregation.

Chinese.—According to Chinese history, music was invented by the Emperor-philosopher, Fuhsi, about 3000 B.C. Emperor Huangti (2700 B.C.) ordered definite laws of music to be established. Sounds were fixed and given definite names. Tsin Shih Huangti ordered the destruction of all books, including those on music (221 B.C.). The monarchs who followed made efforts to revive the art. Chinese songs deal with different forms of nature, such as the trees, and blossoms, the clouds, meadows and hills. Their melodies are formed on the pentatonic or five-toned scale, and range from drinking songs to melancholy moods. Many of their melodies have been mistaken for Scotch for this reason.

The Chinese used flutes, stringed instruments, similar to our modern zither, many kinds of drums, including the famous tam-tam, as well as organs formed of stone plates or bells. These were struck with a sort of mallet.

Hindus.—The *vina,* a stringed instrument of seven strings, stretched across a cylindrical body, is considered the national instrument of India. It should be noted, in considering the music of this ancient land, how the Eastern viewpoint differs from the Western. Where the occidental musician uses the determinate degrees of pitch, called scale-steps, striding from note to note, the Oriental glides along the pitch values lying *between* these notes. There are seven primary notes in the music of the Hindus. From this basis the six "Raags" or male tones are formed. Each "Raag" has five "Raagnia," or female tones. A combination of these produces numberless minor tunes.

Greeks.—There is but little doubt that the Greeks adopted their music from the Egyptians. They considered it an important part of their culture, for the education of the youth was restricted to two subjects, music and athletics. Of their stringed instruments the *lyra* and *kithara* (lyre and cithera) were the most popular. The flute was an important instrument in their music, while trumpets and horns were used occasionally. Their musical system, established by Pythagorus, was the basis from which, later, the 14 *ecclesiastical modes* were evolved. (See Medieval Music, Music of the Early Church.)

Medieval Music.

Music of the Early Church.—Under Ambrose, bishop of Milan (333–397 A.D.) the music of the Church received a great impetus. He collected for use in divine service the chants then in use, based upon the tones D, E, F and G respectively. Pope Gregory (540–604) added four more. These so-called *Ecclesiastical modes* are also known as the *Gregorian modes,* or *Plain Song,* now in use in the Roman Catholic Church. The Monk, Guido of Arezzo (995–1050) noticed that each line of the hymn to St. John began a note higher than the preceding and established the system of sight reading known as solfeggio. He took the first syllable of each line as the name of the corresponding note.

Ut queant laxis
*Re*sonare fibris
*Mi*ra gestorum
*Fa*muli tuorum
*Sol*ve polluti
*La*bii reatum
*Sa*ncte Johannes

Later the *Ut* was changed to *Do* and *Si* or *Ti* added. This system, founded in the 11th century, is still in use.

Secular Music.—Not only was the theory and practice of music being advanced by the Church. A free spirit of untrammeled expression was being cultivated at the same time by the common people. As a result of the Crusades a new species of poetry arose, rich in feeling and expression, and inspired the singing of songs depicting chivalry and love service. These early singers, called *minstrels* or *bards,* recounted deeds of chivalry, also appearing as actors (*strolling players*) in the *Passion Plays* of Germany and the *Mystery Plays* of France. In France they were known as *Jongleurs,* thus distinguishing them from the knightly *Troubadours* who sang their lays to the court ladies.

Of the *Troubadours* (France, Italy and Spain), called *Trouveres* in Northern France, the most distinguished was Adam de la Hale, (1240–80) writer of the pastoral operetta, *Robin and Marion.* Others of importance were Count William of Poitiers (1087–1127), Richard the Lion Hearted of England (1157–99), Chatelaine de Coucy (1157–92), King Thibaut of Navarre (1201–54).

The *Minnesingers* were Germany's bards (love singers). They were not only singers, but epic poets, singers of poetic versions of medieval legends. The more important were

Heinrich von Veldecke, Spervogel, Herman, Landgrave of Thuringia, Wolfram von Eschenbach, Gottfried von Strassburg, Heinrich Tannhäuser, Walther von der Vogelweide, Heinrich von Meissen. Like the troubadours of France, the Minnesingers were of noble birth and met in the Wartburg castle at Eisenach. Wagner immortalized their annual contest in his *Tannhäuser*.

The *Meistersingers* were musically inclined tradespeople. With the decline of feudal power they took upon themselves the advancement of music, after it passed away from the knightly singers. They formed guilds in many large cities. The most renowned order met at Nuremburg and had for its leader the cobbler-genius, Hans Sachs (1494–1576). In his music drama, *The Meistersingers of Nuremburg*, Wagner gives a graphic picture of these amateur musicians and their aspirations.

Folk Song.—The largest class of music lovers was composed of the people themselves. Unfettered by rules and conventions, following their own feelings and instincts, the people's song or folk song attained a high degree of significance about the end of the 14th century.

The Schools of Counterpoint.

The idea of associating two melodies with one another interested the musicians of the Middle Ages, and led to much experimentation. Beginning in France, the movement spread to the Netherlands, later into Italy, giving rise to the opera.

The Old French School was the first to flourish, and exerted its influence from the 12th century until the middle of the 14th. It produced Phillipe de Vitry and Johannes de Muris, who were responsible for the first rules of contrapuntal procedure. From the term *punctus contra punctum* (point against point, or note against note) they called their system *contrapunctus* or counterpoint.

Old English School (1220–1600).—Supposed to have been founded even earlier than the school at Paris. It is credited with the celebrated old canon, in six parts, *Sumer is icumin in* (early 13th century) but the name of the composer is forever lost. The names of Walter Odington, John Dunstable, Redford, Tye and, later, Byrd, Farrant, Gibbons, Tallis are associated with many fine songs, madrigals and choral works.

The Gallo-Belgian School.—Based upon the strictest patterns of contrapuntal development, music was not much more than a display of technical knowledge and cleverness. The canon was the form most used for this purpose. William Dufay (1400–74) was the greatest representative of this school, and eventually became the founder of the great school which succeeded it.

The Netherland School (1460–1560).—At first famous merely because of the exaggerated technical facility of its masters in canonic writing, this school finally brought about a reaction toward a more natural style of composition, and the expression of thoughts and feelings. It produced Johannes Okeghem (1425–1512) and Josquin des Pres (1450–1521) his pupil. The latter, a friend of Martin Luther, was one of the outstanding figures in all musical history. Johannes Tinctoris (1446–1511) and Adrian Willaert (1480–1562) migrated southward, the former to Naples, to found the Neapolitan School of bel canto, the latter to northern Italy, where he founded the instrumental School of Venice. As chapel master of St. Marks (1527) he made use of the two organs of this cathedral for the invention of the double chorus. Willaert also perfected the madrigal. His pupil, Cyprian de Rore (1516–65) was the first to use chromatic harmony, and Andrea Gabrieli (1510–86) employed instruments in the antiphonal manner, both making rich and original contributions to the growth of music.

Claude Goudimel (1502–72), pupil of des Pres and teacher of Palestrina, carried the Netherland teaching into Italy and founded the *Roman Choral School* (1535–1674), to which must be credited the honor of having originated the *oratorio*. Greatest masters were Ferrabosco, Festa, Animuccia, Palestrina, Nanini, Anerio, Allegri, Frescobaldi and Carissimi.

Orlando di Lasso (c 1532–94), greatest master of counterpoint and one of the titanic figures of the entire contrapuntal period, was the first to show that counterpoint could be made to subserve deep religious expression. His style was dignified and his works reflected feelings ranging from penitence to gayest humor.

Pierluigi Sante, called Palestrina, from his birthplace (1526–94), brought polyphonic religious music to its culmination. Although written in a simple, direct style his music is characterized by striking beauty and originality and stamps him one of the most significant figures in the history of music.

The Rise of the Opera.

In the presentation of *Miracle Plays* and *Mystery Plays*, also, later, *Pastoral Plays* with musical accompaniment by the troubadours and jongleurs, we have the first association of stage action with music. The operetta, *Robin and Marion* by Adam de la Hale is, perhaps, the most famous example of the pastoral opera, probably because it has the distinction of being the first.

Florence.—But the real opera, combining drama with music, arose through the efforts of a group of wealthy Florentine nobles, known as the "Camerata." Believing that the Greeks had recited the lines of their dramas to musical accompaniment, they made numerous efforts to revive an interest in this ancient form. The first opera, by Jacob Peri and Rinuccini, named *Dafne*, was performed in 1597, but was later lost. *Euridice*, written in 1600 by the same composers, is therefore the first opera of written record. This opera was written to be performed at the wedding of Maria de Medici to Henry IV of France. Copies were sent to all parts of Europe, and, in this manner, the movement rapidly spread to other schools of Italy, Austria and France.

Venice Monteverdi (1567–1643) used violins in his orchestra. Cavalli (1600–76) first presented the comedy element in Naples.

The Neapolitan Schools (1675–1747) introduced arias, also choruses, duets, trios, etc., and emphasized the vocal display above the dramatic

element. They cultivated the concert overture. Stradella (1645–81) and Allesandro Scarlatti (1659–1725) stand out as the most important composers. Others were Durante, Logroscino, Leo, and Domenico Scarlatti.

France.—The French School of Opera (1645–1764). When introduced into Paris in 1645, opera, in the Florentine style, was very popular. Lully and Perrin, court composers of Louis XIV, founded a distinctive school of French opera. It emphasized the dramatic element, added the brass instruments and kettle-drums to the orchestra, and gave the chorus a part in the dramatic development. Other names associated with this fine work were Cambert, Marais and Rameau.

Germany.—The National German opera arose from the Singspiele (Song Plays) about 1630, in the form of mythological dramatic representations preceded by musical dialogue. Hiller based it upon the folk-song, thus giving it a national flavor. Strungk, Kusser, Keiser, Mattheson, Handel, Teleman, Hiller, Dittersdorf, Schenck, Weigl and Winter further developed the form which was popular with the people. The nobility favored Italian Opera and were catered to in this style by Graun, Doles, and Naumann.

The Rise of the Oratorio.

In 1551 Saint Philip Neri (1515–95) established the custom of inviting the young folks to his chapel or *oratory* of the monastery of San Girolamo, and in Santa Maria, to enact scenes from the Scriptures. The interest was great, and he asked Animuccia, Palestrina, Nanini and others to write music for these Biblical scenes. The first complete work of this oratorio style was Cavalieri's *Representation of Spirit and Body* in 1600.

In Germany the dramatic presentation of Christ's sufferings given during Holy Week was called *Passion Music.* Sacred subjects with musical accompaniment were an important part of the church services and were known as *Church Cantatas.* Famous in this work was Heinrich Schütz (1585–1672). Both opera and oratorio developed vocally and instrumentally until, at the time of Handel, they were looked upon as the greatest medium for the exploitation of vocal expression and display.

MODERN MUSIC

The Great Classicists.

Germany; Classic Period.—Since the earliest times Germany has held a commanding position in the world of music. During the classical period a distinguished group of composers flourished.

Johann Sebastian Bach (1685–1750).—Modern music, as we understand it, may be said to have begun with Johann Sebastian Bach. He represented the culmination of the entire development of all the contrapuntal schools, and although his works may be considered the sum total of the *science of music,* they are distinguished by profound emotional conception and lively imagination. His cantatas, oratorios and Passion Music were imbued with the deepest religious feeling. The basis of modern piano playing is indicated in his great work *The Well-Tempered Clavichord.* Violin music was greatly enriched by him, while his organ compositions are the forever models in this branch of music. His influence upon the progress of music was immeasurable.

George Frederick Handel (1685–1759).—Born the same year as Bach, Handel is alike identified with the German Classic School, the Italian and English Schools. Being attracted by Italian Opera he went to Italy to study. Later he returned to Germany for a time, but was called to direct Italian Opera in England. Upon the accession of the Hanoverian line of Kings to the throne, he received a Royal appointment, which he retained until his death.

His 40 or more operas are now obsolete. His greatest works are the oratorios *The Messiah, Saul,* and *Sampson.* Unlike Bach, however, his works had but little influence upon the development of the art of music.

Christoph Willibald Gluck (1714–87).—While Italian, German and French composers were writing meaningless operas, there appeared in Paris a German-Austrian named Gluck who was concerned in establishing dramatic sincerity and artistic truth. His reform efforts having met but little success in his home town, Vienna, he was attracted to Paris because the French School had been less influenced by the prevailing mode of opera than the others.

He believed that the music of opera should conform to the plot and express the dramatic meaning of the text. Gluck's greatness is revealed in the fact that his influence was felt upon the dramatic works of Mozart, Beethoven, von Weber and Wagner. Of his 54 operas *Orpheus and Euridice, Alceste, Armide, Iphigenie en Aulide, Iphigenie en Tauride,* are the greatest, and are still performed.

Joseph Haydn (1732–1809).—Born in Austria, he was long the director of music at the court of Count Esterhazy. He established the *sonata form,* so important in absolute music, developed the arrangement of the *symphony orchestra* into four divisions—strings, wood winds, brasses and percussion instruments. Haydn's music is notable for its cheerfulness and sincerity.

Quite late in life he visited England, and became enthusiastic over Handel's oratorios. He returned to his home and wrote several oratorios, of which *The Creation* (1799) and *The Seasons* (1801) are the most famous.

Wolfgang Amadeus Mozart (1756–91).—Beginning his musical life as an infant prodigy, famous at the courts of Austria, France and Italy, Mozart developed into the towering musical genius of all time. He was the most lovable and human of the great musicians. He wrote in all forms and was equally great in all. He composed 49 symphonies, of which three are still favored repertoire pieces of our great symphony orchestras—the *E flat, G minor* and *C major* (Jupitor). In his operas Mozart shows great dramatic power, and truthful expression of human nature, yet his music, even in the most complicated polyphonic passages, is alive with exquisite charm, spontaneity and naïve simplicity. His greatest operas *The Marriage*

of Figaro, Don Giovanni, and *The Magic Flute* are as popular as ever.

Ludwig van Beethoven (1770–1827).—The supreme musical genius, and most inspired of all musicians, who represented the culmination of the Classical School, and also ushered in the period of the Romanticists. He carried the art of free thematic development to a point never since surpassed, and imbued his works with profound thought, intense dramatic spirit, emotional and expressional truth, as well as beauty and perfection of form. Beethoven wrote in all styles of composition, overtures, sonatas, chamber music, oratorios, one opera, *Fidelio* and nine symphonies, which constitute a musical monument for all time.

Franz Peter Schubert (1797–1828).—Possessed of the most remarkable gift of melody, Schubert brought the *German art song* to perfection. Liszt called him the most poetic musician who ever lived. Schubert combined melodic simplicity with intensity of expression and poetic charm. His greatest instrumental compositions are his *Symphony in C major* and the *Unfinished Symphony,* perennial favorites in the orchestral repertoire.

Romanticism.

The romantic movement which spread over Europe in the middle of the nineteenth century manifested itself in all the arts. Its influence on the art of music was strongly felt. Freedom of thought and individuality of expression were encouraged.

Karl Maria von Weber (1786–1826).—In Germany the opera was first affected by the wave of romanticism. Karl Maria von Weber chose for his operas, subjects which were highly romantic, but his great service to German musical art lies in the fact that he gave to the German nation its first truly *German opera.* In *Der Freischutz* he presented for the first time a great dramatic work on a German folk-tale, expressed by means of German folk-music, and performed by German singers in the German language. His greatest works are *Der Freischutz, Oberon, Euryanthe,* and *Preçiosa.*

Felix Mendelssohn-Bartholdy (1809–47).—One of the most beloved of composers, whose name is a synonym for *Songs without Words.* By reason of his poetic temperament he was eminently fitted to express the romantic spirit of the times. His overture to *A Midsummer Night's Dream* of Shakespeare, composed when he was but 17, proved that he was a master of tone painting. His greatest contributions in larger forms were his oratorios, *St. Paul* (1836) and *Elijah* (1846) and his *Scotch* and *Italian Symphonies.* His overtures *The Hebrides, Calm Sea and Prosperous Voyage* and his famous *Violin Concerto* are almost as popular as his *Songs without Words.* All of his works are characterized by elegance, poetry, religious fervor, melodic charm and mastery of technical expession.

Robert Schumann (1810–56).—The greatest and most significant exponent of romanticism was Robert Schumann. Possessed of a powerful imagination, poetic insight, humor and extravagant emotionalism, his music was, perhaps, deeper and more impassioned than that of Mendelssohn. Like the latter he was understood best through his smaller compositions, but his *Symphony in B flat,* the *Quartet in E flat,* the *Quintet,* the great *Piano Concerto* and his *Sonata in G minor* and *Variations for piano* are powerful pieces of music. In his songs he revealed a gift of emotional expression that was well nigh perfect.

Frédéric François Chopin (1810–49).—"The poet of the piano," a refined genius, opened a new era in piano playing. His compositions breathed a depth of thought and feeling, power and poetic import which verged toward program music. His independent virtuosity represented the liberation of the piano style from the traditional orchestral and choral influence. He made use of the national Polish characteristics in much of his music—mazurkas, polonaises and waltzes. The scherzos, concertos, ballades and etudes are works of titanic power, originality, imagination and charm.

CONTRIBUTIONS TO MUSIC BY COUNTRIES

Italy.

Italy, the land of beauty and romance, gave us the first musical notation. The *Neumes,* first written musical signs, were invented by Italian monks. In the 11th century the monk, Guido of Arezzo (995–1050) introduced a four-lined *staff,* and established the method of *sight singing* that is in use today.

Italy made further contribution to the art of music when Petrucci invented *music printing* from movable types in 1502.

Modern violin playing received its foundation in the work of Arcangelo Corelli (1653–1713). A composer, whose works still hold an important place in the repertoire, was Giuseppe Tartini (1692–1770). Violin playing was revolutionized by his improvements. Italy's greatest violin virtuoso was Nicolo Paganini (1782–1840), whose musical life reads like a romance.

Euridice, the first opera, was performed in Florence in 1600. Rapid improvements in the vocal drama followed, but the vocal display was emphasized to such an extent, at the expense of the dramatic element, that in time, Italian Opera became merely a singing concert. Instead of the music expressing the dramatic meaning of the text, all sorts of florid and meaningless arias, trills and roulades were used in order to exploit the singer. As the people demanded no better, the composers wrote no better.

A famous opera writer, to whom the world is indebted for many beautiful lines, was Gioacchino Rossini (1792–1868). His masterpieces were *The Barber of Seville* and *William Tell.* The former work remains to this day a perennial favorite in the operatic repertoire.

The grand old man of Italian Opera was Giuseppe Verdi (1813–1901), unquestionably the greatest master the Italian Opera has ever known. *Rigoletto, Il Trovatore* and *La Traviata* were triumphs of his early period. His later operas, *Aïda, Otello* and *Falstaff* have been rightly placed in the front rank of operas.

Aside from Pietro Mascagni (1863), whose *Cavalleria Rusticana* has been very successful, Ruggiero Leoncavallo (1858) earned rec-

ognition with his *I Pagliacci.* But the logical successor of Verdi was no doubt Giacomo Puccini (1858), who has won great renown with his *La Bohème* and *Madame Butterfly,* the sensational success of which has eclipsed the equally fine operas *Manon Lescaut, La Tosca* and *Edgar.*

Since the birth of opera in 1600, the Italian folk song has been largely employed in that form. Thus, most of the "folk" music sung throughout Italy is really popular music from the best known operas.

France.

After the decline of the wandering minstrels, France lost some of her musical prestige, but the development of the opera in the 17th century enabled her to regain the lead. The pioneer in opera, Babtiste Lully, wrote many operas and court ballets. The ballets contained many dances, among them the stately minuet, the dignified saraband and the lively gigue, all in triple rhythm. In duple rhythm were the refined gavotte and the rollicking bouree. These dances and others were favorites of the nobility.

The first great master of the orchestra was Hector Berlioz (1803–69). To him belongs the honor of being the founder of the modern *Program Music.* He was a composer of powerful individuality. His best known compositions are *The Fantastic Symphony,* the music drama, *The Damnation of Faust,* the dramatic symphony *Romeo and Juliet,* the overture *Carnaval Romaine* and the opera *Benvenuto Cellini.*

Although of Italian birth Luigi Cherubini (1760–1842) was for many years associated with the French School, and held the position of Director of the Paris Conservatory. His best known works are *Medée* and *Les Deux Journées.*

Gasparo Spontini (1774–1851), another gifted Italian, director of the Italian Opera in Paris, was very fond of pompous, heroic subjects. *La Vestale* is his greatest effort.

Jacques Halevy (1799–1862) has achieved lasting fame with his great opera, *The Jewess.*

Charles François Gounod (1818–93) is best known for his masterpiece, the opera *Faust.* A genius, who met with an untimely death was Georges Bizet (1838–75) whose opera *Carmen* and the *L'Arlesienne* music give us a never-ending delight. Among more recent opera composers of France was Jules Massenet (1842–1912). Among his many fine creations are *Manon, Thaïs, Herodiade, Le Cid, La Navarraise* and others.

César Franck (1822–90), the first to take up the modern trend of composition, a master of rare genius, with a style of great fascination and beauty. His most imposing works are the oratorio, *The Beatitudes* and the noble and very lovely *Symphony in D minor.*

Vincent d'Indy, a pupil and follower of Franck, but whose admiration of Wagner resulted in strong influence of *Tristan and Isolde* and *Parsifal* being noticeable in his works. His outstanding work is the *Mountain Symphony,* which is quite a favorite with orchestral conductors. He was born in 1851.

Claude Achille Debussy (1862–1918), famous for his radical tendencies, which have received the name elusive sonorities because of the vagueness of effect he has produced. His best works are full of the most delicate poesy, and ethereal charm. His much discussed innovations have since been accepted. The orchestral prelude *L'Après-midi d'un Faune* and the opera *Pelléas and Mélisande* are great favorites with the public.

Gustav Charpentier (1860–), is well known through the great success of his opera *Louise.* He is a follower of César Franck and Massenet.

Maurice Ravel (1875–1937), a composer of fearless, independent expression, leaning somewhat on Debussy and also on Richard Strauss.

The death of Camille Saint-Saëns (1862–1921) deprived France of one of her greatest tone poets. His powerful opera *Samson and Dalila* has had very great success. His symphonic poems indicate that he is to be classed as a program composer. Some of his best are *La Danse Macabre, Le Rouet d'Omphale, Phaëton. The brilliant Piano Concerto in G minor* is a favorite with concert pianists.

Giacomo Meyerbeer (1791–1864) was the leader of the opera and dominated its rather doubtful ideals until the advent of Wagner. He was brilliantly gifted, but sought imposing stage effects of a melodramatic order rather than artistic ideals. Many of his operas are still very popular with the class of people who desire the melodramatic style in opera. His greatest repertoire pieces are *Robert Le Diable, Les Huguenots, Le Prophète, L'Africaine.*

Germany.

Richard Wagner (1813–83).—Although formerly attacked as being mere noise and without meaning, Wagner's dramas are now considered as being without parallel. Wagner's ideals were to bring about entire unity of expression between music, drama and interpretation. For this purpose he used highly individualized musical fragments for reminiscent effects, called *leading motives,* in the choice of which he was exceedingly fortunate because of the exactness with which they fit the person, feeling or situation which they are meant to represent.

His finest works are the colossal *The Ring of the Nibelung,* consisting of the four parts, *Rheingold, The Valkyrie, Siegfried,* and *The Dusk of the Gods, The Meistersingers of Nüremburg, Tannhäuser, Parsifal.* No doubt Wagner's conception of the mutual relations of music, poetry and action will remain the basis of opera for a long time to come.

Johannes Brahms (1833–97), the man of whom Hans von Bülow remarked, "The three great 'B's' in music are Bach, Beethoven and Brahms." At the time when composers, generally, were seeking new and sensational means of expressions, Brahms upheld the traditions of the old classical forms as used and perfected by Haydn, Mozart and Beethoven. Although full of warm feeling, intensity and great exaltation, Brahms' works are not easily grasped at one hearing. Real enjoyment of his works, especially his monumental symphonies, is gained only through great familiarity with his peculiar idiom.

Richard Strauss (1864–) was the outstanding figure in musical Germany in recent years, writer of most astonishing program music.

Aiming to make music the means of expressing every conceivable emotional or mental experience, his symphonic poems depict the gruesome and ugly as well as the sublime and beautiful. His most popular poems are *Don Juan, Death and Transfiguration, Till Eulenspiegel's Merry Pranks, Heldenleben,* and *Sinfonia Domestica.* His weird operas *Salome* and *Elektra* created a sensation, but are seldom heard now, perhaps because of their gruesome plots.

Karl Goldmark (1830–1915), a follower of Wagner, who has had considerable success with his operas, *The Queen of Sheba* and *Merlin.*

Arnold Schönberg (1874–), exponent of "linear counterpoint," the latest type of "eye music" but cacophonous to the verge of insanity. His most acceptable composition, so far as the public is concerned, is *Guerre-lieder.*

Russia.

Out of Russia, that dark land of sorrow and oppression, has come a veritable treasure-store of music. For generations the downtrodden peasants sought to lighten their heavy burdens with songs and dance. Consequently, many of their songs are quite melancholy, others full of fiery exultation. The alternation of these extreme moods may be said to be the outstanding characteristic of Russian music.

The Russian expresses in music every event in his life, from birth to death. He has songs of marriage, harvest, the seasons, death, labor, and play. The sacred music of the Greek Church has also left its mark on Russian songs. Russian choral singing is world famous, for no instruments are permitted in the Church, therefore, the choruses are unsurpassed.

Native composers are greatly indebted to the folk songs of their country for the beauty, strength and national character of their music.

Michael Ivanovitch Glinka (1804–57).—That this wealth of folklore was a gold mine for composers was first realized by Glinka, called "the father of Russian music." His *A Life for the Czar* was considered the first real Russian opera.

Modest Mussorgsky (1839–81), talented, but unschooled composer of the neo-Russian style, found great success for his opera *Boris Godounov.*

Peter Ilyitch Tschaikovsky (1840–93), the greatest composer Russia has given the world. He has found and logically applied the most sombre and also the most brilliant orchestral colors for the expression of the characteristic Slavonic temperament. Of flamboyant nationalism, his music always gives the impression of spontaneous originality. His greatest works are his *6 symphonies,* of which the 4th, 5th and 6th are great favorites of the concert public, the fantasies for orchestra, *Francesca da Rimini* and *Romeo and Juliet,* also the powerful *March Slav* and the *Overture 1812.* His great *Piano Concerto in B flat minor* is one of the display pieces of the modern pianist. Tschaikovsky's operas are unknown outside of Russia.

The Invincibles. A newer and very distinctive school was formed by Mili Balakirev with the aid of César Cui, Alexander Borodin, Modest Mussorgsky, and Nicholas Rimsky-Korsakoff. Their aim was to cast out all foreign influences from Russian music, in which endeavor they were quite successful.

Borodin, a physician by profession, wrote music in his spare moments, and produced the very fine opera *Prince Igor.* He was born in 1834 and died in 1887.

The member of this national group who is best known outside of Russia is Rimsky-Korsakoff (1844–1908). His symphonic poem *Scheherazade* based upon the *Arabian Nights* is a favorite concert number with orchestras. Of his operas *The Snow Maiden* and *The Golden Cock* have been given performances at the Metropolitan Opera House at New York.

Recent Russian composers who have become famous are Alexander Glazunov (1865–1921) and Sergei Rachmaninov (1873–), the latter being considered not only one of the greatest pianists of the day, but also one of the outstanding composers. The extremely interesting rhythms, but bizarre and extravagant use of the orchestra have made the works of Igor Stravinsky (1882–) and Sergei Prokofief (1891–) a source of discussion rather than of pleasure. The future will decide how much the world wants their extreme sort of music.

Czecho-Slovakia.

Of all the Slavic nations Bohemia has the liveliest folk songs and folk dances. The polka is the favorite Bohemian dance, and receives its name from "pulka" meaning "the half" and referring to the halfstep which occurs in the dance. Another popular dance is the furiant. The famous composer, Dvořák, introduced it into his *First Symphony,* using it in place of the usual scherzo.

A real Bohemian School of Music was established by Friedrich Smetana (1812–84). While visiting the great pianist, Liszt, he heard Herbeck say that the Czechs were not original, but were merely imitators. He decided to disprove this and succeeded most brilliantly. His operas include bright comedy, among which *The Bartered Bride* is justly popular. Its overture is an international favorite. Being a pupil of Liszt, it is but natural to find that, in his instrumental compositions, Smetana used the form of the symphonic poem, of which Liszt was the inventor. He invariably used folk music and folklore in carrying out his program.

Antonin Dvořák (1841–1904) carried on the work begun by Smetana. Born of the peasant class, he had a thorough acquaintance with the folk material of his country. In his compositions he used the native melodies with rare skill. He is quite as eminent in the history of Bohemia as Tschaikovsky is in that of Russia. His chamber music and the last symphony, *From the New World* are the compositions best known in this country.

Zdenko Fibich (1850–1900), another leader in nationalism in Bohemian music, perfected the modern melodrama, or recitations with music. His best work in this form is a trilogy called *Hippodamia.*

Joseph Suk (1874–), a son-in-law of Dvořák, has become famous as a modernist.

Poland.

The reconstruction of Poland since the war reminds us of her past sorrows and glories. Her musicians have woven her glorious but pathetic history into their compositions. Polish folk songs have the inevitable melancholy which is characteristic of a people that has been oppressed for centuries. The lively airs are full of fire, as the Poles are a very passionate race.

Songs and dances are a part of the life of the people. Nearly all the occupations of the peasants are accompanied by songs. A popular dance of the people is the Krakowiak (named after the district of Cracow). It is performed by many couples, each of which stops in turn before the musicians and sings a little song to the dance tune, which is being played. In this manner songs are associated with dances.

It takes a real Pole to feel the elusive spirit of the vivacious mazurka. Chopin immortalized this form in his wonderful *Mazurkas*. He was as patriotic as he was musical. All his lovely piano pieces reflect the spirit of his native land. He felt the downfall of his country very keenly, and portrayed his feelings of melancholy and patriotic fervor in many of his works, such as the *Military Polonaise, The Revolutionary Etude* and the famous *Funeral March*.

Another Polish Dance of which Chopin has given us splendid examples, is the polonaise. It is the dance of the aristocracy. It is in triple time, although of a march-like character. It was invented in 1574 when Henry, Duke of Anjou, became king of Poland. The polonaise was invariably played on state occasions, when the nobles marched before the king.

Henry Wieniawski (1835–80) was famous both as a violinist and as composer. His excellent pieces are based upon Polish melodies and rhythms.

Many of the world's greatest pianists have been of Polish birth. Ignace Jan Paderewski (1860–), whose artistry aroused the wonder of the world, when in his prime, is the outstanding example. He is also a composer of very great ability. His delightful *Minuet in G* is, no doubt, known in every home where there is a piano. His opera *Manru*, the *Piano Concerto* and the *Polish Fantasy* as well as the two fine *Legends* are his more pretentious works.

Josef Hofmann (1877–), perhaps the greatest of the concert pianists now before the public, was also born in Poland but is now a citizen of the United States. He has written many fine songs and piano pieces.

Other distinguished Polish musicians now residing in the United States are Leopold Stokowski, famous conductor of the Philadelphia Symphony Orchestra, Felix Borowski, composer, conductor, critic and President of the Chicago Musical College, Sigismund Stojowski, eminent pianist, teacher and composer.

Of all the Polish singers who have made great reputations, none were greater than Marcella Sembrich, marvelous soprano, and the brothers Jean and Edouard De Reszki, unexcelled as dramatic opera singers.

England.

England reflected some of the romance and gay life of France after being conquered by the Normans. All the musical instruments were then imported from France and Italy.

The Elizabethan era, which was remarkable for the revival of literature, was also renowned for considerable progress of music. Wherever Queen Elizabeth went it was made a special feature of all functions. Shakespeare, in his plays, refers repeatedly to music and the important part it held in court life. A beautiful song of that period is *Drink to Me Only with Thine Eyes*, words by Ben Jonson, but composer unknown. Although about 200 years old, this song is very popular today.

The pioneer of modern English music was Henry Purcell (1658–95), considered by many England's greatest musician. He wrote operas and sacred works that still retain their freshness.

At the time of Handel the *ballad-opera*, a sort of English *Singspiel*, became popular. The first of these, produced in 1727, was John Gay's *Beggar's Opera*. Others associated with this inferior form of opera were Henry Carey (1685–1743), supposedly the composer of *God save the King*, and Thomas Arne (1710–78), who also wrote many operas, oratorios, and songs. These ballad-operas were based upon popular airs, and satirized the customs of the day. They really interfered with the growth and production of more serious operatic works.

The greatest composer in England in the early 19th century was Michael Balfe (1808–70), an Irishman, who wrote some fine operas, the most famous being *The Bohemian Girl*.

The late 19th century produced a number of fine musicians who sought to raise the standards of musical production. Prominent among these were Sir Arthur Sullivan (1842–1900), whose fame rests upon his satiristic operas, written in collaboration with Sir W. S. Gilbert; Arthur Goring Thomas (1850–92), Charles Hubert Parry, born 1848, Alexander Mackenzie, born 1847, Frederick Cowan, born 1852, Charles Villiers Stanford, born 1852, and Granville Bantock, born 1868.

The two outstanding composers of fame are Samuel Coleridge Taylor (1875–1912) and Edward Elgar, born 1857. Taylor was an English Negro, whose treatment and development of Negro melodies have given him a fine standing among composers. His setting of *Hiawatha* is his most pretentious work. Sir Edward Elgar may be called the composer-laureate of England, and has taken a stand in the front rank of the world's composers. Among his many fine works are several remarkable symphonies, concertos, and the great choral works, *The Dream of Gerontius* and *Caractacus* are considered by many the finest oratorios since Mendelssohn.

Frederick Delius (1863–1934), Percy Aldridge Grainger, born at Melbourne, Australia (1882–) and Cyril Scott (1879–) are making an enviable record for themselves, each in his own way. Grainger, recently made an American citizen, has devoted himself to the development of early English folk-music. Delius has created some excellent compositions along original lines of counterpoint, while Scott is looking to national sources for his inspiration, being, however, somewhat inclined toward the impressionism of modern France.

Japan.

During the Helan period of Japanese history (from the eighth to the twelfth century), music was cultivated by all people of social standing. It was an age of luxury, and dancing, singing and playing were among the chief occupations of the nobles.

The *kotow* is the oldest and most important of their instruments. The *biwa,* like our mandolin, and the *gekhin,* which resembles our banjo, are used to accompany the songs of a light style. Both are played with a plectrum.

Many of the Japanese melodies are constructed upon the pentatonic, or five-toned scale. The songs of Nippon are noted for their strong political feeling. Although it is less than 50 years since occidental music was introduced into Japan, appreciation of it has been astonishingly rapid. Luther Whiting Mason was called as superintendent of music in the schools of Japan in 1880, and in three years had built up a course of instruction according to modern standards.

Foreign artists from Europe and America, giving concerts in Japan, report a remarkable appreciation for the most complicated compositions. Japan's most prominent native composer is Foscak Yamada.

Hungary.

Hungary, the land of the Magyar, possesses music which is deeper, wider and more distinctive in its expression and feeling than any other European nation. In no other country are there as many musicians who play without being able to read musical notation.

It is to the gypsies that the world owes its appreciation of the true Magyar music. In every village there is a gypsy band. The violin and the czimbalom are the instruments most used. The czimbalom was created by the Hungarians for the proper rendition of their music. What the banjo is to the American Negro the czimbalom is to the Magyar. Notes are not used.

The Magyars, who are the real Hungarians, are of Oriental origin, hence their music has a semi-barbaric quality, largely based upon a syncopated rhythm.

It is the combination of the Gypsy and Magyar elements which has produced the distinctive national melodies. The Hungarian has provided the rhythms, while the Gypsy has added the trills, turns and other characteristic ornaments.

Hungary's struggle for independence is reflected in her folk songs, which are melancholy and passionate. The brooding spirit has impregnated even their dance music. The national dance is the Czardas, containing two parts, one slow and mournful, called Lassen, the other wild and impassioned, called Friska. These alternate at the will of the dancer.

Franz Erkel, who composed the national hymn, also wrote the first real Hungarian opera, *Maria Bathori,* produced in 1840.

Hungary's greatest musician was Franz Liszt (1811–86). He was undoubtedly the greatest piano virtuoso that ever lived. As a composer he leaned toward the new German school and programism. He invented the *symphonic poem* and wrote many of his best works in that form. His best known are the *Faust Symphony, Les Preludes, Tasso, Lament e Trionfo.* In his *Hungarian Rhapsodies,* he depicts the human emotions from tragic sorrow to the intoxication of the dance. They are tonal pictures of the Hungarian and Gypsy peasant life, a little more "flashy" perhaps, than his other works, but having an appeal of their own. His music is being received with greater appreciation than ever before.

Finland.

Finland's national progress, politically and culturally, has been a thorn in the side of Russia. The Finns are an independent people and have retained their customs in spite of Swedish and Russian domination. They are of Mongolian descent, which accounts for the Oriental strain found in their music.

As early as the seventeenth century efforts were made to collect the wealth of Finnish folk songs. Dr. Elias Leonnrot finally succeeded in making a collection of the old tunes or ballads, which he called *Kalevala.* It is the national epic of the Finns, an enormous work, and was published in 1835. It was declared, on the authority of Max Müller, the famous scholar, to be equal to the Greek *Iliad,* and "the fifth great epic of the world."

Finnish music has always been of a somber character. The history and climate of Finland are both, in a measure, responsible for this. In the northern part the sun disappears entirely during the middle of the very bitter winter. And the persecution by the Russians has also had its effect on the temperament of the people. Thus, it seems that the Finn is happiest when singing some weird, melancholy song.

Music, as a fine art, received no recognition in Finland until 1835 when the University of Helsingfors was founded. Frederic Pacius (1809–91), a German musician, born in Hamburg, was called to the chair of music and did much to encourage better music in his adopted country. He composed the music for the national hymn, *Fatherland,* the poem of which was written by Johan Ludvig Runeberg, Finland's greatest poet.

The *Musical Institute of Helsingfors* has done much to stimulate the love of music in Finland since it was founded 20 years ago.

Among present-day composers, Armas Jaernfelt (1869–) is known for the beauty and originality of his orchestral works. The music of Selim Palmgren (1878–) is rapidly gaining in popularity.

The most distinguished and celebrated composer of Finland, however, is Jean Sibelius (1865–), who has been granted an income by the government so that he may devote himself entirely to composition. American concert-goers are most familiar with his two beautiful tone poems, *Finlandia* and *The Swan of Tuonela.* The patriotic meaning of *Finlandia* so aroused the Finns that the Russian government forbade the further performances of the work.

The later Sibelius, represented by his last symphonies, has conceived works that are not for sweetness and light. His music is darkly, somberly passionate, the utterance of a tragic poet, full of the power of a heroic epic poem. There are the same virile traits of strength and

grim dignity which have made the *Kalevala*, Finland's national poem, one of the greatest epics of the world.

Norway.

In Halfdan Kjerulf (1815–68), the nationalistic element in Norwegian music first became apparent. Feeling strongly the folk songs of his native land, he wrote melodies for the lyrics of Björnson, which became the songs of the people.

Equally patriotic was Ole Bull, the famous violinist (1810–80), who founded the National Theater at Bergen, and induced Henrik Ibsen to become a director. He, too, discovered the musical genius of Grieg, and persuaded the latter's parents to make a musician of him.

Edvard Hagerup Grieg (1843–1907) imbued his compositions with the distinctive atmosphere of his country, to which is due much of their charm. Harmonies which owe their weird and delightful effect to the Norwegian folk songs upon which they are based, characterize Grieg's works, and, together with his clever, musicianly treatment of his motives, are responsible for the delightful appeal which his compositions have. His songs are especially full of poetic feeling, although the two *Violin Sonatas* and the splendid *Piano Concerto* are wonderfully popular with the concert public. Best known of all his compositions, no doubt, is the *Peer Gynt* music written for the drama by Ibsen.

Johann Svendsen (1840–1911) has a more cosmopolitan style, and his four masterly *Norwegian Rhapsodies*, although most excellent music, are not nearly as intensely nationalistic as the music of Grieg. His *Romance* for violin is a favorite with violinists.

Norway's best living composer is Christian Sinding (1856–) upon whose shoulders the mantle of Grieg seems to have fallen. Having spent much of his time in Germany, the influence of the German School is shown in some of his songs and shorter compositions, but his larger orchestral works are strongly Norwegian in character.

United States.

Very marked progress has been made in American music since the Civil War. We have in our ranks composers who have written music of undying quality. Although we still are very far from possessing an American style or school, there is little doubt but that we are establishing a *representative* type of music.

Everyone knows how truly representative the much beloved songs of Stephen Collins Foster (1826–64) are. Full of pathos and original expressiveness, they are truly undying examples of American musical art. *The Old Folks at Home, Old Black Joe, My Old Kentucky Home* are some of the favorites of the people.

The most distinguished composer America has produced is Edward MacDowell (1861–1908), a composer of strong individuality, whose music is of a very poetic nature. His best loved compositions are the *Witches' Dance, To a Wild Rose*, the lovely *Indian Suite*, for orchestra, and his four powerful Sonatas for piano, *Tragica, Eroica, Keltic*, and *Norse*. His death was a great loss to American music.

Horatio Parker (1863–1919), most scholarly of composers, whose *Hora Novissima* is undoubtedly the finest oratorio written by an American, and his opera *Mona* won the $10,000 prize offered by the Metropolitan Opera House.

Henry K. Hadley (1871–), conductor and composer of fine songs and virile orchestral works.

America has not lacked its opera composers, both of the serious and lighter kinds. Frederick Converse is known through *The Sacrifice* and *The Pipe of Desire*, Parker for the prize opera, *Mona*, Walter Damrosch for *Cyrano*, Charles Wakfield Cadman for his Indian opera *Shanewis*, Henry Hadley for his *Cleopatra's Night* and *Azora*, Victor Herbert for the serious opera *Natomu*, and numerous light operas, Reginald De Koven for *Rip Van Winkle*, and the fine comic operas, *Robin Hood, Rob Roy*.

Other prominent American composers are Henry F. Gilbert, Manna Zucca, Henry Holden Huss, Arthur Whiting, Mrs. H. H. Beach, John Powell, Henry T. Burleigh, C. M. T. Loeffler, Felix Borowski, John Alden Carpenter, Joseph Breil, John Philip Sousa, Ethelbert Nevin, Harry Rowe Shelley, William Berwald, Bruno Huhn.

The American public has gratefully appreciated the fine artists which it has had the privilege of enjoying, and is proud of such names as Farrar, Neilson, Schumann-Heink, Nordica, Homer, Eames, Mary Garden, Alma Gluck, Whitehill, Witherspoon, Bonelli, Arthur Hartmann, Bispham, Galli-Curci, John McCormack, Elisabeth Rethberg, Ossip Gabrilowitsch, Rudolph Ganz, Gigli, Heifetz, Ernest Hutcheson, Joseph Lhevinne, Mischa Levitzki, Elly Ney, Sigrid Onegin, Rosa Ponselle, Rosa Raisa, Samaroff, Ernest Schelling, Joseph Schwartz, Zimbalist, Harold Bauer, Martinelli, Giannini, Elman, Chaliapin, Sophie Braslau, Lucrezia Bori, Frances Alda.

OTHER DISTINGUISHED COMPOSERS

ARENSKY (*ä-rĕn'skĭ*), **ANTON** (1861–1906). Associated with younger Russian School.

BALAKIREV (*bä-lä-kē'rĕf*), **MILLI** (1837–1910) of the neo-Russian School, through whose leadership a national school of musical composition was developed.

BARNBY, SIR JOSEPH (1838–1896). Composer of *Sweet and Low*, numerous hymns, anthems, secular and religious choruses.

BEACH, MRS. H. H. A. (1867–). American woman composer, choral works, *Gaelic Symphony, Jubiltte*, a *Mass in E flat*.

BENNET, SIR WILLIAM STERNDALE (1816–1875). Foremost among the English musicians of his time, a fine pianist and a composer of much graceful music.

BOSSI, ENRICO (1861–). Italian composer of intensely modern style. Ranks high among his contemporaries.

BRUCKNER (*brŏŏk'nĕr*), **ANTON** (1824–1896). Austrian composer who ranks high among the serious artists. He adapted Wagner's principles to the orchestral works, producing compositions of brilliancy and power.

BUCK, DUDLEY (1839–1909). Famous as organist and composer in American musical circles for many years.

BULOW (*bü'lō*), **HANS VON** (1830–94). Great German pianist, and remarkable orchestral conductor.

DUKAS (*dü'kas*), **PAUL** (1865–1935). Composer of very brilliant orchestral works, best known of which is *The Sorcerer's Apprentice.*

FRANZ (*fränts*), **ROBERT** (1815–92). German composer, whose songs compare with those of Schubert, Schumann, and Brahms.

GADE (*gä'dĕ*), **NIELS** (1817–90). Danish composer of originality, though leaning toward Mendelssohn's style.

GERMAN, EDWARD (1862–1936). English orchestral composer, best known by the incidental music he has written to various Shakespearean plays.

GODARD (*gō'dăr'd*), **BENJAMIN** (1840–95). French composer of marked talent.

HENSELT, ADOLPH (1814–89). Composer of many excellent piano pieces in the "salon" style.

HELLER, STEPHEN (1815–88). Hungarian pianist and composer, friend of Chopin and Liszt. His works are characterized by lovely melody, fresh and vigorous treatment of theme. His style somewhat resembles Mendelssohn.

HOLMES, AUGUSTA (1847–93). Successful woman writer of operas and other works in larger forms.

HUBER, (*hōō'bĕr*), **HANS** (1852–1921). Swiss dramatic composer who ranks as the best composer in Switzerland. His best works are the operas *Gudrun* and *Der Simplicissimus,* and the beautiful orchestral works, *Pandora, Nordseebilder,* and three fine symphonies.

KJERULF (*kyā'rōōlf*), **HALFDAN** (1815–68), Norwegian composer of songs from whom Grieg received much of his inspiration. Many of his songs were specially written for Sontag, Jenny Lind, Christine Nilssom and others, who made them popular throughout the world.

KORNGOLD, ERICH (1897–), Austrian composer who showed precocious talents and who has since proved his ability as a writer in orchestral and piano works of remarkable fertility, originalty, and workmanship.

KREISLER, FRITZ (1875–), Austrian violinist and composer, whose compositions have an atmosphere of "Old Vienna."

LESCHETIZSKY (*lĕs-chĕ-tĭts'kĭ*), **THEODOR** (1831–1915), eminent pianist, composer and teacher of the art of piano playing. He gained a world-wide reputation as an instructor, because of the great success of his pupils, Paderewski, Bloomfield-Zeisler, Mark Hambourg, and Gabrilowitch. He published an opera, *Die erste Falte,* the piano compositions *Souvenirs d'Italie, Suite à la campagne* and numerous others.

MAHLER (*mä'lĕr*), **GUSTAV** (1860–1911), great opera conductor and successful composer. His second symphony is an excellent composition.

NICODE (*nĭk'ō-dā*), **JEAN** (1853–), composer of many fine works in larger forms.

RAFF, JOACHIM (1822–82). His *Forest Symphony* has had great success, but is not heard very often now.

RHEINBERGER, JOSEPH (1839–1901), well known composer of organ and chamber music, who also had a great reputation as a teacher of harmony, counterpoint, and composition.

SCHUTT (*shüt*), **EDWARD** (1856–), fine pianist and composer of many popular piano pieces.

SGAMBATI (*sgäm-bä'tē*), **GIOVANNI** (1843–1914), Italian composer and teacher. His reputation, however, is chiefly confined to his native country.

WOLF, HUGO (1860–1903), writer of rather intense songs and ballads. His opera, *Corregidor,* has been well received.

THE MODERNISTS.

The present era is one of musical extravagance which has deliberately severed itself from tradition and shows a more violent divergence than ever before witnessed in a transition from one period to another. Composers repudiate the hitherto acknowledged laws, make daring experiments in dissonances, and in the treatment of the orchestra.

Atonality and Polytonality.

During the Classic period, the great masters established, as a firm basis of understanding, the principle of *tonality,* or *key sense,* in which all the tones of a given key were related to one fundamental tone, as point of attention. This tone, or "keynote," was the center of the system of tones, and a sort of musical law of gravitation attracted all tones toward it.

Later, an increasingly intimate relationship between chords of different keys was discovered, and, beginning with Franck, we find that some composers considered this intimacy of relationship of greater moment than the underlying sense of key or tonality. Gradually, greater and greater liberties were taken with (and within) keys. One restriction after another was removed and all the materials of all keys were promiscuously intermingled, much as individual words from various languages might be arranged in order. Thus the sense of tonality was definitely suspended. This constitutes, in its broadest sense, what is known as *atonality.* Such groupings are often very vivid and powerful, and, no doubt, are the logical result of the desire to express the increased exhilarations of the present day.

The compounding of the materials found in all keys naturally led next to the compounding of the keys themselves, and the music maker found himself reveling in newly revealed prospects, finding and experimenting with entirely novel effects, sometimes pleasing, sometimes bitterly strident. The music of moderns, in short is a veritable *marriage of keys,* so that we find two totally different keys going in double harness.

It is the logical outgrowth of the idea of polyphony, in which two or more melodies moved along simultaneously. This employment of two different factors has now been extended to include the simultaneous sounding of *two different chordal columns,* each in its own key; *different color timbres* of the orchestra opposed to each other; *different complex rhythms* used at the same time. These new applications of the idea of counterpoint are still in the experimental stage with many composers, and, although it may be said that, what is called *polytonality* (many keys) is the characteristic technical procedure of the ultra-modern in music, the result, generally, is a continual tissue of dissonance. This stridently inharmonious effect is deliberate, persistent, and cheerfully remorseless with modern composers.

The Glamour of Modernism.

Much of our ultra-modern music is silly, puerile, senselessly ugly, abortively experimental, artificial rather than artistic, deliberately distorted and unmusical. It is true, that, as an antidote for extreme reactionary stupor, we require the other extreme of radical expression, and perhaps this stage of experimentation is not unlike that experienced in the early attempts at polyphony, during the history of the contrapuntal schools.

Knowing that they are dealing with something quite new (and queer) composers have become fanatical in their worship of the grotesque. In what may well be called the *barbaric style* they resort to all the tricks and arbitrary asperities of mere noise-makers. *Atonality, poly-*

tonality, the *whole-tone scale,* new methods of *chromaticism,* novel *counterpoints of rhythm,* and *timbre* are all intermingled and exploited in in a veritable worship of queerness.

Musical Barbarism may draw upon the music of primitive or warlike peoples, the Indians, Cossacks, Bedouins, Negroes, for local color, or it may dress itself in semi-civilized garb, and portray battle-scenes, tell stories of so-called chivalry (extreme programism) and fairly revel in the presentation of the cruel, the lustful, gruesome or brutal.

Such backgrounds provide the composer with ample opportunity (and excuse) for the display of his sensational devices. A story or program, essentially Oriental or primitive, is used to kindle, and, for a time, sustain the listener's interest. It will thread its way through intricate tonal windings, physically disagreeable passages, and even dynamic horrors. Alien chords of polytonal discovery march in double harness with ever-increasing noisiness. The composer's aim is to dazzle, bewilder, stun, and, finally, overwhelm with a titanic outburst of sound.

The School of Elusive Sonorities.

In contrast with the above strenuous style we have the *School of Elusive Sonorities,* employing amorphous passages, in which the melody, harmony and rhythm disappear in a strange, opaque mist of tones, and all sharp outlines dissolve into vague, fantastic shapes. Composers belonging to this school are found portraying cloudlets, wall-paper patterns, swirling waters, foggy shapes, colored gardens in the glare of the sunshine and quivering waves of heat on glinting or vibrating surfaces.

Others conjure up an impalpable world of fancy, and envelop it in an atmosphere of filmy mysticism. They seek effective expression in shimmering, high tones, conspicuous discords, and progressions in which every chord is a surprise. All they achieve is sensation, occasionally very pleasing, it must be admitted, but, as a rule both mentally and emotionally meaningless.

Igor Stravinsky (1882–), the Russian modernistic composer, is perhaps the leader of the school which exploits the *counterpoint of rhythms,* timbres and keys, while Alfredo Casella (1883), Italian musician, is an outstanding exponent of the Barbaric School. Arnold Schönberg (1874), Austrian musical intellectualist, is the founder of the new School of Linear Counterpoint. Alois Haba is the champion of the Quartertone Scale, dividing the octave into 24 equal quarters, and has written music from their basis. Franz Shreker thinks he has something new in the form of Folk-Opera. Alexander Scriabin (1872–1915) discovered a new basis for the construction of harmony, and, in his later works, brought forth something differing from the much frayed whole-tone scale. He expressed rather fanciful ideas of religious mysticism. Claude Debussy found in the impressionistic school of elusive sonorities, largely atonal, the liquid style suited to his delicate, ethereal poesy.

Other representatives of modern trends are Ottorino Respighi (1879–), an Italian Master, who has achieved novel effects through the modern use of old Ecclesiastical Modes, Manuel de Falla, clearly accepted leader of the new Spanish generation, Arthur Honegger, son of Swiss-German parents, who is quite Teuton in the solidity of his forms and workmanship, Milhaud, one of the French "Six."

The situation with respect to composers, therefore, seems somewhat confused. We know only that groups of composers, of all nationalities and in all countries, appear to be "feeling their way." It is to be hoped that, out of their experimentation there may be born something which will give the world a fresh idiom. It is indeed difficult to say in just what manner all these streams may be merged into a logical composite, yet, when we remember how the various developments of the contrapuntal age found their ultimate culmination in a Bach, it is plausible to assume that in due time a Bach, Beethoven or Wagner will appear to gather up the various threads, in order to weave them into a firm and acceptable fabric.

How widespread these trends are, is attested by the fact that everyone of these schools of innovation has its several representatives in every country. Germany has its Paul Hindemith, Ernest Krenek (a born Czech) atonalists, Walter Braunfels, and Heinrich Kaminski, France its Auric, Poulenc, Roussel, Italy its Malipiero, Candonai, Rieti, Castelnuovo, Tedesco, Russia its Roslavetz, Miaskovsky, Medtner and Feinberg, Hungary its Bartok and Kodaly, England its Bax, Berners, Holbrooke, Harty, America, its Gershwin, who, although working in jazz style, has avoided the customary tawdriness and lack of originality of the jazz school, Leo Sowerby, John Powell, Howard Hanson, Aaron Copland, Rubin Goldmark, Czecho-Slovakia its Joseph Suk and Leos Janacek. The attempts to follow Strauss-ism, Debussy-ism, Stravinsky-ism and Schönberg-ism, and applying one or more of them to the task of remaining nationalistic in his own country is the problem facing each composer. In other words the strict nationalists blinded by the glamours of modernistic possibilities, have not hesitated to adopt the ideas of "Internationalists."

It is generally conceded that Stravinsky and Schönberg are the two most striking composers of the times. The contemporary atonalists and polytonalists are speculative composers, whose efforts are constructed upon mechanical principles. Schönberg and Stravinsky still evade the general, still whet our curiosity, still await final appraisal. However the world may ultimatey rate them, it is by no means done with them and their music.

Music in the Public Schools.

"Music is the art of expression in tones." "To make America musical" is the slogan adopted by educators. Its importance as a curricular and extra-curricular subject in our public schools is being appreciated.

The aims and purposes of present day courses of music in the grades and high schools should be stated definitely because:

1. The various states of the Union are at present revising their respective curricula, and, to the end that there may be some uniformity of general objectives, the subject should be brought to the attention of the people.

2. Parents are expected to assist their children to some degree in their home study, and in order that this may be done intelligently, they, too, should be informed of the objectives and methods of procedure used in the school.
3. Knowing the importance of the subject, parents will insist that music be no longer considered a frill, an extra, or a luxury to be dropped by the student upon the slightest provocation.

There are two preliminary steps in musical training of children in the schools. The first is the *singing of songs by imitation* without any thought of technical elements or efforts to apply them consciously; the second is the *introduction and application of technical elements*, for the purpose of reënforcing and strengthening the imitative and memory processes.

While no hard and fast rule can be given as to the exact materials that should be used in a given grade, general lines of objectives may readily present themselves. Classes will differ as to the degree of mental background and hereditary ability possessed by their members, the amount of music there is to be heard in their homes, etc. To bring the objectives into some semblance of logically sequenced groups is the first important step.

The teachers of grades one, two, and three may be considered as having as their constant aim the task of:

1. Providing *musical experience* for the students, through *active participation*, which shall develop a love and appreciation for the art.
2. Providing a repertoire of *rote songs* suitable for the children, and a knowledge of a reasonable number of standard *community songs*.
3. Establishing and maintaining *right attitudes* toward good music.
4. Suggesting, and assisting in ways and means of stimulating *creative tendencies* in children.

During the gradual progress of the student the teacher should attend, with great care, the matters of:

1. Voice production and placing, training the child's ear to distinguish between *good and bad tone quality*, maintaining the beautiful quality peculiar to children.
2. Developing a *rhythmic feeling*, or sense of time, through rote songs, singing games, folk dances, suggested rhythms, toy bands, etc.
3. To prepare the students to *read and interpret* simple music material.
4. Studying such elementary facts of *music notation* as are necessary to the student's progress in reading and interpreting simple music materials, whether songs or exercises. This includes a knowledge of clefs, signatures, major scales, rhythms, ear training, dictation.
5. Drilling the students in *pitch*, including special work with monotones, to master the syllable-names.
6. Drilling students in *rhythm*.
7. *Sight reading*, giving the student the facility of recognizing and producing instantaneously the tone represented by a printed note. This implies good preparation in syllable reading.
8. *Musical appreciation*, which should be an integral part of every lesson.
9. Beginning *creative work*, writing simple, *original melodies*.

Continuing into the Intermediate Grades, four, five, and six, the work adapts itself somewhat as follows:

1. A study of the child's singing voice and the adaptation of materials to early changes (adolescent voices).
2. Selecting and studying rote and art songs adaptable to the intermediate grades.
3. Methods of:
   (*a*) Formal technical drills for *rhythm* and *ear training*.
   (*b*) Systematic practice in *sight-reading* to develop power and facility. The use of the *Minor mode* (*La* scale).
   (*c*) Preparation for and presentation of *part-singing*, including the development of *harmonic sense*.
   (*d*) Presenting directed and undirected *listening lessons*, to further the higher sense of musical appreciation.
   (*e*) Simple *conducting*, showing the student the advantages of being able to conduct community singing, church choirs, choral work, or the orchestra or band.
4. Stimulating *creative tendencies*, writing *original melodies, making of simple musical instruments*.

The *problems of time* should be introduced according to a definite plan of gradation, single-beat tones first, then two tones to a beat, the unequally divided beat, dotted note, etc.

The *problems of pitch*, also, may be introduced in their logical order, beginning with scale and chord progressions, and gradually bringing in the different interval relations.

The *changing voices* of boys should have ample provision. Most unison songs are within medium range, also, many part songs provide an alto part of very small range, not too high for the so-called tenor-alto voice. Bass melodies, generally speaking, may be sung by the boys, with changed voices.

The fundamentals of *Music Appreciation* in the *Primary Grades* may be summed up in the understanding of:

1. Rote Songs
   (*a*) Nature
   (*b*) Animal
   (*c*) Holiday
   (*d*) Lullabies
2. Singing Games
3. Tonal Work
   (*a*) Imitative exercises for curing so-called monotones
   (*b*) Building the tonal vocabulary.
4. Rhythm Work.
   (*a*) Through Rote Songs
   (*b*) Singing Games
   (*c*) Folk Dances
   (*d*) Suggested Rhythms
   (*e*) Toy bands.

Music Appreciation in the *Intermediate Grades* can be attained through:

1. Rote Songs
2. Observation Songs
3. Use and Understanding of the musical tools

(*a*) Symbols; sharps, flats, slurs, ties, loud, soft, etc.
(*b*) Knowledge of Key Signatures.
(*c*) Knowledge of Meter Signatures.
(*d*) Knowledge of Pitch names.
(*e*) Rhythmic expression; Andante, Allegro, Moderato, etc.
(*f*) Sight-reading.
(*g*) Sight-singing.

4. Music should be correlated with other subjects of the curriculum and the life of the child through:
(*a*) Folk songs
(*b*) Folk games
(*c*) Art songs
(*d*) Classics in instrumental music, with the aid of mechanical agencies, player-pianos, talking machines, etc.

Music in the High School.

The work of the teacher, beginning with the seventh grade, or thereabouts, is to make the sight reading processes, begun in the preceding years, so definite and accurate, that they of themselves lead to *expressiveness* and *spontaneity* in the singing.

The same program of problem study and application as followed in the lower grades, must be repeated in the seventh grade and up, the work being readjusted to cover the greater mental maturity of older pupils. This means greater technical difficulty of the songs and a broader musical content.

Along with the active participation of the students in the manner above indicated, more comprehensive courses in History and Appreciation should be included, covering

1. The *history* and development of music with reference to the *instruments* used in its production.
2. The *great contributors* to modern music.
3. The chief *forms* in music.
4. The parts of an *Orchestra and Band.*
5. An *appreciation* of some of the typical musical productions now current.

Suggestions:

1. Bring about individual and group expression by class. Simple *illustration of music* (both operatic and incidental) after having previously developed a *mood.*
2. A study of *instruments,* their developments, and their *modes of expression.*
3. Other forms of expression, that is, *solo, duets, trios, quartet, ensemble.*
4. Use of story, pictures, drama, and poetry to help establish a mood. *Programism.*
5. History and *biography,* used as enriching supplementary material.
6. Arouse a desire in the student to *express himself* in music.
7. Help students to a knowledge of what may interpret or *express a mood.*
8. Make clear the following:
(*a*) What music is.
(*b*) Examples of early music.
(*c*) Early American types, Afro-American, Indian.
(*d*) Study of instruments, precussion, brass, reed, string.
(*e*) Orchestras, how developed, the great orchestras, located.
(*f*) Symphony, overture, program music.
(*g*) Bands, and their music.
(*h*) The human voices, sopranos, altos, tenors, baritones, and basses.
(*i*) Oratorio, what it is. Difference between oratorio and opera.
(*j*) Opera, grand (serious), comic.
(*k*) Schools of music and their representative composers.
(*l*) Folk and national music. Italy, France, Germany, Russia, Czecho-Slovakia (Bohemia), Poland, England, Japan, Hungary, Finland, Norway, America.
(*m*) Modern tendencies in music.
(*n*) Benefit of music in the schools.

There is much to be grateful for in the good arising from the teaching of music in the public schools, in the stimulation of interest through community music, music week, in the fine work of reproducing instruments and the radio. Boards of education everywher are of one opinion concerning the place music merits in the public schools. The number of authoritative courses for the training of music supervisors indicates the importance of this branch of work. The experience of the public, too, in listening to public school choruses and orchestras and bands has been illuminating.

INSTRUMENTAL MUSIC (ORCHESTRA AND BAND) IN THE PUBLIC SCHOOLS.

The question which naturally suggests itself to parents when asked to allow their children to play in the school orchestra or band is, "How may our children and our school be benefited if the pupils are encouraged in learning to play instruments?"

Music lifts one to a higher level of living, aesthetically, and morally, gives pleasure and profit. It is economically valuable. The number of people in each community who earn money through music is surprising.

Music has a definite influence upon the intellectual life. It is one of the most valuable all-around subjects at our disposal for training children in quickness of perception, in acuteness of visual and auditory analysis, in rapidity of coördination, and in the keener observation of symmetry and unity.

The director of music in the schools of one of our largest cities says, "The value of public instruction in music would be tripled by a manifestation of interest upon the part of parents in the music, which the child is trying to learn to appreciate at school." Every Parent-Teacher Association can further the coöperation between home and school by asking each member to fill out a questionnaire, something like the following:

1. Have you a musical instrument in your home? What is it?
2. What kind of music is played?
3. What do you know about the musical selections your child is studying in school, or playing in the school orchestra?
4. Would you like your child to play in the school orchestra?
5. Will you give your child an opportunity to learn to play some instrument, and give him time to practice?

The orchestra or band of the school makes it possible to interest many children, especially

boys, in music, at that crucial stage, where upon reaching the voice-changing age, they find that their interest in singing is not so keen as formerly, and, because they do not now care for singing, they care very little about music in general. At such a point, the appeal of an instrument turns the tide.

However, parents should see to it that the child takes the band or orchestra work seriously. The regular discipline which a pupil undergoes in orchestral practice, of yielding in obedience to the dictates of the conductor, is a very valuable training for the child. It makes *obedience a habit.* If this were all that the child received from its association with the school orchestra it would be worth a great deal.

Orchestral Instruments.

The symphony orchestra is divided into four sections, according to the character of the instruments which compose it. These various "families" of instruments are balanced as to members so as to make the best blending of "colors" or timbres. The modern orchestra contains from 60 to 110 performers. The groups are as follows:

- **String**
  - First Violins
  - Second Violins
  - Violas
  - Violoncellos
  - Contra-basses
- **Wood-wind**
  - Flutes
    - Piccolo
    - Flutes
  - Single Reeds
    - Oboes
    - English Horn
    - Bassoons
    - Contra-Bassoon
  - Double Reeds
    - Clarinets
    - Bass Clarinet
- **Brasses**
  - French Horns
  - Trumpets
  - Trombones
  - Tuba
- **Percussion**
  - Tympani or Kettle Drums
  - Snare-drum
  - Bass Drum
  - Triangle
  - Bells
  - Cymbals
  - Tam-tam

Aside from these most orchestral scores now contain parts for one or two harps, which belong to none of the above choirs of instruments.

The String Choir.

The strings are the most important group, and, when played together are capable of expressing almost any thought or feeling.

The Violin.

The **Violin** was introduced into the orchestra by Monteverde, seventeenth century. The violins of the orchestra are divided into two groups, first and second violins, the former being comparable to the soprano, the latter to the second soprano or alto parts. A great many especial effects may be produced upon the violin according to the manner in which the bow is drawn across the strings. Bowing near the bridges produces a rough, harsh quality, while bowing nearer the finger-board results in a soft, mysterious quality.

Pizzicato, the plucking of the strings with the finger suggests harp effects, which are always very popular. *Sordinos* or *mutes,* applied to the violin, produce a veiled, mysterious quality often used for reveries, lullabies, mournful effects.

The Viola.

The **Viola** was used by the Venetians in the early seventeenth century, under the name *viola da braccio* or *arm fiddle.* It has a soft, noble quality, rich and penetrating, of wonderful pathos. It possesses a deeper compass than the violin, being tuned a fifth lower than the latter.

The Violoncello.

The **Violoncello** has a quality more nearly like the human voice than any of the orchestral instruments. It was developed out of the *knee fiddle* or *viol di gamba* of the seventeenth century. It is tuned an octave lower than the viola, and its deep, full voice may reflect almost any sort of condition. Because of its great compass, the 'cello may be used as the bass of the string group, as a solo instrument of power and virile expression, or as the melody-carrier with the accompaniment of other instruments.

The Contrabass.

The **Contrabass** was little known, and its possibilities little realized, until the time of Beethoven. It is the fundamental bass part of the string group, and sounds an octave lower than written. The "tremolo" or trembling of the bow on the strings, which is used upon all the string instruments, is effective upon the bass, in representing storm, or sentimental effects. The *pizzicato* is often used, and is an intensely dramatic effect when combined with other menacing colors.

The Harp.

The **Harp,** although one of the oldest of instruments, is a recent addition to the orchestra. Aside from its history in connection with the ancient Egyptians and Hebrews, it may be noted as one of the popular instruments of the people generally, standing out in its importance in Ireland, Scotland and Wales.

In the orchestra, the harp is treated either in broad effects or in arpeggios. It adapts itself readily to serenades, prayers, religious or march scenes.

The Wood-wind Instruments

The combined wood-wind instruments approximate the effect of an organ, and suggest the atmosphere of festivity, religion, pomp, etc. It has been said that the flute may be called the coloratura soprano of the wood-winds, the oboe the lyric soprano, and the clarinet the dramatic soprano.

The Flute.

The **Flute** is one of the oldest instruments in the orchestra. It is possessed of marvelous agility, although capable of expressing sadness as well as joyousness. It is very popular as an

obligato instrument, because it blends so perfectly with the color of the human voice. In the orchestra three flutes are used.

The **Piccolo**, or octave flute, covers the very highest pitch levels. It is seldom used alone, but is very effective for piercing, shrieking, agonizing effects. It is most useful in combination with the flutes and other wood-winds.

The Oboe and English Horn.

The **Oboe**, developed from the pipes of the Greeks, is a double reed instrument. The tones are produced by the vibration of reeds attached to the mouthpiece. These reeds are thin pieces of cane, two of which are fitted close together, in the oboe, English horn, bassoon and contrabassoon, all of which are double reed instruments.

The quality of the oboe is soft and tender, but of great penetration. It suggests rural scenes, and is especially fitted for melodies of a romantic nature. It is capable of expressing sadness, grief, agitation.

The **English Horn** is the alto oboe. It stands in the same relation to the oboe that the viola does to the violin. It is tuned a fifth lower than the oboe. It has been used in the orchestra only since the time of Berlioz, who first recognized its great expressive qualities. Its veiled, dreamy tone is full of emotional color.

The Clarinet.

The **Clarinet** is one of the most useful instruments in the orchestra. A single flat reed is the tone producing agency. The Clarinet has a very large range, its lowest register being earnest and religious in quality, its highest shrill and rough. Rameau first used it in opera, but it was Mozart who understood it as a leading voice of the orchestra.

The **Bass Clarinet**, pitched an octave lower than the clarinet, has a deep, noble, impressive tone, and, in its lower registers, sinister, dramatic colors. Meyerbeer was the first to use it in the opera. It was a favorite instrument of Wagner and Liszt.

The Bassoon.

The **Bassoon**, the bass of the double reed group has a great compass, the upper range being very similar to the human voice, and effective in pastoral scenes. Depression and fear are well portrayed by the upper registers. The deepest register is very comical.

The **Contra-Bassoon**, is occasionally required for the grandiose effects of the deepest harmonies. It also is capable of grotesque effects.

The Brass Choir.

The **Brasses, combined** as a choir, have a solemn, noble, devotional character, and are capable of very beautiful, rich tone effects, resembling the organ.

The Trumpet.

The **Trumpet** is the highest of the brass instruments. Its soft tones are very beautiful, but it is only called upon to carry the melody where the brass section plays alone, or in moments of brilliant, forcible climax. It suggests boldness, chivalry, victory, etc.

French Horns.

The **French Horn**, developed from the old hunting horn, is a most genial instrument, possessed of a noble, poetic quality. Its tones are full of passion, pathos, and solemnity. Echo effects are produced by means of the mute. The stopped tones produced by placing the hand in the bell of the instrument result in a nasal, discordant, shudder-arousing quality, often used to reflect danger, strife, discord, revenge, etc.

Trombone-Tuba.

The **Trombone** possesses a grave, majestic, heroic quality, and in most of the solemn, dignified music, requiring grandeur, power, religious feeling, it plays an important part. Three trombones are generally used in the orchestra, using the tuba for the bass of the quartet. Most composers are careful in the use of the trombones, and employ them only at moments of overwhelming expressiveness.

The **Tuba** is the bass of the brass section. Its tone is gruff, but noble and dignified. It is combined with the trombones in the expression of grandeur, power, nobility, majesty, sublimity.

The Percussion Instruments.

This group of instruments is often called *the battery*. The various instruments are used for characteristic effects. The most important of these are the Tympani.

The **Tympani**, or **Kettle Drums** are instruments of copper, in the form of large kettles, covered with vellum heads, and are tuned by the use of screw-keys. The player is often called upon to change the drums into another key, while the rest of the orchestra remains in the original key.

Two or more tympani are generally employed in the orchestra and are capable of suggesting storm-scenes, dramatic effects, dirges, requiems, etc.

The **Drums.**—The **Snare drum**, or **military drum**, has snares or catgut strings which produce a rattling, incisive tone. It is used in music of a military character.

The **Bass Drum**, the large drum, is generally used in symphonic music to mark the rhythm, at an approaching climax or to imitate thunder. It is usually associated with the cymbals.

The **Bells.**—The most familiar form of bells used in the symphony orchestra is the Glockenspiel or carillon, played with a keyboard.

The **Triangle**—a triangular bar of steel, which is struck with a metal rod. Its tone is sharp and incisive, but of indefinite pitch, so that it may be used in all keys.

The **Cymbals** are circular disks of metal which are struck together, or with a wooden hammer. The metallic clang thus produced has an almost shrieking quality and is effective in dramatic climaxes. Used very softly, they are also of fine effect.

The **Tam-Tam** or Chinese Gong, a huge metal disk, of Chinese origin, produces a terrifying tone, of use where conditions of horror, wildness and dramatic power are carried to their height.

The **Celesta**, a piano-like keyboard used to sound tuned plates of steel, producing the tin-

kling bell-like tones of the bells. Later composers, since Tschaikovsky, employ the celesta in place of the other forms of bells.

THE INSTRUMENTAL GROUPS IN THE MILITARY BAND.

The instruments of the military band may be visualized readily in their respective qualities and methods of employment in the following tabulations.

Instruments, which produce a sharp, bright, penetrating tone, in the:

High register	The Piccolo Flute
High and Middle register	The Clarinet
Middle register	Cornet, Trumpet
Middle and lower register	Trombone
Lowest register	Tuba

Instruments which produce a soft, sonorous tone:

High register	Flute
Middle register	Horns, Alto Horn, Tenor horns, Baritone, Saxophone.

Instruments producing a whining tone:

High register	Oboe
Lower register	Bassoon.

In the military band the clarinets take the part represented by the violins; first clarinets being used just as the first violins would be, the second clarinets like the second violins. The part of the violas is taken by the alto and tenor horns, the 'cellos by the baritones, the bass violins by the tubas. The flutes, horns, trumpets, trombones, and percussion groups are used in the same manner as in the orchestra. The above general rule holds good in arranging orchestral music for military band.

FAMOUS ORCHESTRAS

Austria:
Vienna—
Philharmonie Orchester. Conductors, Felix Weingartner, Franz Schalk.
Symphonie Orchester. Conductors, Clemens Krauss, Leopold Reichwein, Hans Knappertsbusch, Anton Kourath.
Volks Orchester. Conductor, Karl Berger.
Ladies Symphonie Orchester. Conductor, Julius Lehnert.
Innsbruck—
Musikverein Orchester. Conductor, Emil Schennich.
Stadtisches Orchester. Conductor, Dr. Kohler.
Salzburg—
Mozarteums Orchester. Conductor, Bernhard Paumgartner.

Czecho-Slovakia:
Prague—
Czech Philharmonic Orchestra. Conductor, Vaclav Talich.

Denmark:
Copenhagen—
Royal Opera House Orchestra. Conductors, Georg Hoeberg, Johan Hye-Knudsen.

France:
Paris—
Societé des Concerts. Conductor, Philippe Gaubert.
Colonne Orchestra. Conductor, Gabriel Pierne.
Lamoureux Orchestra. Conductor, Paul Paray. The Colonne and Lamoureux Orchestras have at times been combined since the war, as one organization. Conductors, Gabriel Pierne, Camille Chevilard.

Germany:
Berlin—
Philharmonic Orchestra. Conductor, Wilhelm Furtwangler.
Cologne—
Gurzenich Konzerte. Conductor, Herman Abendroth.
Cologne Symphony Orchestra. Conductor, A. Kuntzmann.
Dresden—
Orchestra of the State Theater. Conductor, Fritz Busch.
Dresden Philharmonic. Conductor, Ed Moericke.
Frankfort—
Frankfort Symphony Orchestra. Conductor, Ernst Wedel.
Museum Concerts by the Opera Orchestra. Conductor, Ludwig Rottenburg.
Hamburg—
Philharmonic Orchestra. Conductor, Siegmund von Haussegger.
Leipsic—
Gewandhaus Orchestra. Conductor, Wilhelm Furtwängler.
Munich—
National Opera House Orchestra. Conductor, Hans Knappertsbusch.
Stuttgart—
Landestheater Orchester. Conductor, Prof. Leonhardt.

England:
London—
Queen's Hall Orchestra. Conductor, Sir Henry Wood.
London Symphony Orchestra, Landon Ronald.
Manchester—
Halle Orchestra. Conductor, Sir Hamilton Harty.

Italy:
Rome—
Augusteum. Conductor, Bernardino Molinari.
Milan—
Orchestra of the Scala Theater. Conductor, Arturo Toscanini.

Norway:
Oslo—
Philharmonic Orchestra. Conductor, Jose Eibenschutz.

Russia:
Leningrad—
State Philharmony Orchestra. Conductor, Nicholas Berdiaiev.
Moscow—
Russian Philharmony Concerts. No permanent conductors. Chief of Orchestra, Prof. Leo Zeitlin.

Sweden:
Stockholm—
Royal Court Orchestra. Conductors, George Schneevoigt, Conrad Nordquist, Armas Jarnfeldt.

United States:
Boston—
Symphony Orchestra. Conductor, Sergei Kussevitzky.
Chicago—
Symphony Orchestra. Conductor, Frederick Stock.
Cincinnati—
Symphony Orchestra. Conductor, Fritz Reiner.
Cleveland—
Symphony Orchestra. Conductor, Nickolai Sokoloff.
Detroit—
Symphony Orchestra. Conductor, Ossip Gabrilowitsch.
Los Angeles—
Symphony Orchestra. Conductor, Walter Henry Rothwell.
Symphony Orchestra. Conductor, Henri Verbrugghen.
New Haven—
Symphony Orchestra. Conductor, David Stanley Smith.
New York—
Philharmonic Orchestra. Willem Mengelberg.
Symphony Orchestra. Guest conductors pending the election of regular conductor to replace Walter Damrosch.
Philadelphia—
Symphony Orchestra. Conductor, Leopold Stokowski.
San Francisco—
Symphony Orchestra. Conductor, Alfred Hertz.
Syracuse—
Symphony Orchestra. Conductor, Vladimir Shavitch.

GREAT OPERAS

AIDA. Giuseppi Verdi. Cairo, 1872.
At Memphis and Thebes, in the reign of the Pharaohs.

Act. I.—Aïda, taken captive by the Egyptians, is given to Amneris as a slave. Radames, her lover, also loved by Amneris, is chosen to lead the Egyptians against the Ethiopians under Amonasro, Aïda's father. Act II.—Amneris discovers Aïda's secret by pretending that Radames has been killed. He returns triumphant with many captives, including Amonasro, disguised as a soldier. Offered whatever boon he desires, Radames asks for the freedom of his captives, which was granted to all but Amonasro. The king bestows upon Radames, his daughter, Amneris. Act III.—Accompanied by Ramphis, the high priest, Amneris goes to the Temple of Isis to pray for Radames's love, and there overhears Aïda, her father, and Radames plan to flee from the court. She denounces Radames. Act IV.—Before his trial, Amneris pleads with Radames to explain, but he refuses, is tried and condemned to be buried alive in the stone vaults beneath the altar of the God of War. While Radames awaits his fate in the vault, and as the great stone which seals his tomb is swung into place, Aïda is discovered within and the lovers are united in death; Amneris dies of grief above the altar stone.

BARBER OF SEVILLE. Gioacchino Rossini. Rome, 1816. *Seville, Spain.*

Act I.—In love with Rosina, who is so jealously watched by her guardian, Dr. Bartolo, that his attempts to see her are fruitless, Count Almaviva, having made the acquaintance of Figaro, the barber, is advised by him to enter the doctor's house in the guise of a soldier. Rosina recognizes him and sends him a note, which is found by the doctor, who has Almaviva arrested. Act II.—Again the Count gains admission in the guise of a music master, and all is going well when Basilio, the real music master, appears, but is bribed to depart. Bartolo discovers the trick and sends at once for the notary to draw up the marriage contract between Rosina and himself. Basilio returns with the notary, is again bribed and with Figaro witnesses the signing of the marriage contract between the lovers. Bartolo is pacified with Rosina's dowry.

CARMEN. Georges Bizet. Paris, 1875.
Seville, Spain, beginning of nineteenth century.

Act I.—The Spanish gypsy, Carmen, lives only for sensuality. After she has loved many, she it attracted by the sergeant, Don Jose, who is in command of a troop of soldiers assembled in the village where is located the cigarette factory in which she has wounded one of her mates. She is imprisoned and placed under the guardianship of Don Jose, whom she bewitches, and secures release, for which he is put under guard. Act II.—Carmen returns to her tribe, who appear before the inn of Lillias Pastia to dance. Among them is Escamillo, the toreador, who fascinates her. Don Jose, released from prison, deserts his company for her and is persuaded to join the smugglers, who capture Zuniga, the captain, and carry him off. Act III.—Weary of Don Jose, Carmen entices Escamillo to the smugglers' cave, where the rivals combat. Michaela appears with a message for Don Jose from his mother, who is dying; he tries to prevent Carmen from accepting Escamillo's invitation to the bull fight. Act IV.—On returning, he finds her in the arena with Escamillo, to whom she has promised her love if he is the victor. Don Jose tries to reawaken her love but she repulses him and flings his ring at his feet. As the trumpets announce Escamillo's victory, Don Jose stabs her through the heart.

CAVALLERIA RUSTICANA. Pietro Mascagni. Rome, 1890. *A Sicilian village.*

Act I.—Turiddu, a peasant, before entering military service, had wooed Lola, whom he finds married to Alfio when he returns to the village; he tries to console himself with Santuzza, who loves him ardently, and they are engaged. Lola, who cannot endure to have him marry Santuzza, flirts with him until he has forgotten his betrothed, who in turn becomes very jealous and sad. Santuzza pleads with his mother, who tries to help her. On Easter morning, when people are on their way to church, Santuzza meets Turiddu and reproaches him; he flings her from him. Angered by his treatment, she tells Alfio that his wife is false to him. The two men meet at Lucia's inn and challenge each other. Turiddu repents, but meets Alfio in combat and is killed; Santuzza dies in a swoon.

DER FREISCHUTZ. Karl Maria von Weber. Berlin, 1821. *Bohemia, about* 1750.

Act I.—Max, a young ranger in the service of Prince Ottokar of Bohemia, loves Agatha, daughter of Kuno, chief ranger, and has been promised her hand if he wins the contest in marksmanship. He fails, the prize being awarded to Kilian, a peasant. While in a desperate mood, he is approached by Caspar, a dissolute fellow-ranger, who has sold himself to Zamiel, the Demon Hunter of Bohemian tradition, a sort of Mephistopheles. Caspar also loves Agatha, but knowing that his soul will be forfeit unless he brings another victim in his place, he sees his chance to appease Zamiel, and at the same time remove Max as a rival. Act II.—Agatha awaits, with alarm, her absent lover. After her prayer, Max arrives, much agitated. He declares he must go to the Wolf's Glen to bring in a stag he has shot. In reality he has been induced by Caspar to meet him in the Wolf's Glen to receive the charmed bullets which Zamiel alone can make. Agatha, knowing the reputation of the place, begs him not to go, but he insists. Act III.—Amid scenes of picturesque terrors and supernatural horror the bullets are cast in the presence of the dread Zamiel himself. Six bullets are for Max to use as he wishes, the seventh Zamiel may direct as he likes. The scene changes to the contest, and Max having already spent his six bullets, is directed to shoot a passing dove. He does so, but the bullet just misses Agatha. But a magic garland of roses given her by a pious hermit protects her. When the smoke has cleared away it is found that Caspar has been wounded by the bullet which was directed by Zamiel. The latter drags Caspar away. Max confesses his guilt, but upon intercession of the hermit, he is forgiven by the prince.

DON GIOVANNI. Wolfgang Amadeus Mozart. Prague, 1787. *Seville, Spain.*

Act I.—Don Giovanni, Spanish libertine, is attracted by Donna Anna, the daughter of the commandant of Seville. He breaks into the palace at night to force his love upon her. She calls for help. The commandant comes to her aid, but is killed in the struggle which ensues. Don Giovanni escapes unrecognized. Act II.—Donna Elvira, his deserted wife, follows him to Seville. He makes love to Zerlina, a peasant girl, the betrothed of Masseto, an honest workman, while his servant, Leporello, distracts the attention of Elvira. Donna Anna enters with her lover, Don Ottavio, and, recognizing Don Giovanni as her father's assassin, joins with Elvira and Ottavio in a vow of vengeance against him. Act III.—Don Giovanni gives a ball to celebrate Zerlina's marriage, during which he tries to seduce her. He is prevented by the entrance of Anna, Elvira, and Ottavio, who have made their way into this palace in masks and dominoes. Act IV.—Don Giovanni, still untouched by the vengeance of the three conspirators, is free to continue his amorous activities. After various experience, he finds himself before the statue of the murdered commandant. In a spirit of bravado, he jokingly invites the statue to sup with him. To his surprise the invitation is accepted. Later, when the merriment is at its height, the marble man, with heavy step, enters, and offers Don Giovanni a choice between repentance and eternal damnation. When Don Giovanni, proud and insolent, refuses, the statue grasps him and drags him, amid earthquakes and flames, to eternal torment.

ELEKTRA. Richard Strauss. Dresden, 1909.
King's palace of Mycene, shortly after Trojan War.

Act I.—Clytemnestra, with the aid of her lover, Aegisthus, murdered her husband, Agamemnon, and now fears discovery by her children, Elektra, Chrysothmes, and Orestes. Elektra, who is filled with a desire for vengeance, tries to get her sister's aid in killing the guilty pair. Orestes, her brother, who was said to be dead, had been banished, and appears to Elektra, who tells him the truth about their father, and together they plan revenge. He goes within the palace and accomplishes his purpose. Elektra, overjoyed at his success, dies in a delirious dance.

FAUST. Charles Gounod. Paris, 1859. *German village.*

Act I.—Faust, a student, dissatisfied with his success in scientific research, and his advancing age, calls upon Mephistopheles, who shows him a vision of Marguerite, whereupon he sells his soul to Satan and is transformed into a handsome youth. Act II.—Marguerite, a pure-minded girl, is left in the care of Siebel by her brother Valentine when he goes to war. At a festival before the city gates, she refuses to dance with Faust. Act III.—Siebel binds a bouquet for Marguerite in her garden, the flowers fade, but are revived after being dipped in holy water. Faust and Mephistopheles witness this and the latter leaves a casket of jewels at her door, which she discovers, and adorns herself with; when Faust appears she surrenders herself to him. Act IV.—Valentine, returning from the wars and learning of his sister's misfortune, challenges Faust, but through the aid of Mephistopheles is overcome and dies cursing Marguerite. Act V.—Marguerite, in want and misery, remorseful of her wrong, kills her child, for which she is imprisoned. Faust, desiring to save her, gains access to her prison and begs her to flee; she refuses and, praying for forgiveness, dies; the angels bear her to heaven.

FLYING DUTCHMAN, THE. Richard Wagner. Dresden, 1843. *Coast of Norway.*

Act I.—A Norwegian sea captain, Daland, was driven ashore by a storm. While he and all his crew are asleep, a ghostly ship dashes against his vessel, and is held fast. A pale man with black beard, dressed in black, steps ashore. He tells his story; that having broken his troth, he is compelled to roam the seas without rest; at the end of every seven years he is cast ashore to find a wife who will be true to him forever, which will end his voyaging. When he hears that Daland has a daughter, he asks for her as his wife. Tempted by gold, Daland consents and both ships set sail. Act II.—Senta, the daughter, is much impressed by the picture of the Flying Dutchman, and declares she would save him by her fidelity. Erik, the huntsman, in love with Senta, hears her declaration and tells her his dream of her father's return with a stranger, who carried her off to sea. She listens with delight and Erik leaves in despair. Daland returns with the stranger, who is introduced as her betrothed. Act III.—Later in the evening Erik returns and reproaches Senta for her broken vows to him, which the stranger overhears. Overwhelmed with despair, he calls his crew, tells Senta of the curse, and reveals that he is the Flying Dutchman. Hardly has he departed when Senta flings herself into the sea. Her faithfulness to him is his salvation. The spectral ship disappears and Senta and the Flying Dutchman are seen ascending into heaven.

FRA DIAVOLO. Daniel F. E. Auber. Paris, 1830. *Village of Terracina, Italy, nineteenth century.*

Act I.—The Roman governor has offered a reward and sent dragoons to capture Fra Diavolo, a celebrated bandit chief. Lorenzo, the officer in command, is in love with Zerlina, daughter of Matteo, the innkeeper. While the dragoons are at the inn, Lord Cockburn, an Englishman, and his wife, Pamela, arrive, and declare that they have been robbed. Lorenzo and his men set out to capture the thief. Cockburn is jealous of the attentions paid his wife by their traveling companion, Marquis of San Marco (Fra Diavolo), who listens to Zerlina's story of the famous brigand. He pays court to Pamela, and secures from her a costly medallion set with jewels. Lorenzo returns with the stolen property, wins his reward, and hopes to win Zerlina. Act II.—The English couple are conducted to their rooms next to Zerlina's chamber. Fra Diavolo plans further robbery and conceals himself in Zerlina's closet. He gives a prearranged signal to his comrades in the courtyard below and they enter her room and again rob the English couple. A noise outside awakens them, Zerlina appears, and the robbers escape, aided by Fra Diavolo, whose presence arouses the jealousy of Cockburn and Lorenzo, the latter challenges him to a duel. Act III.—Diavolo, in bandit dress, awaits Lorenzo in the forest, as Zerlina and the rich farmer, Francisco, approach with their wedding procession, in which are Diavolo's accomplices, who are arrested and compelled to aid in capturing Diavolo, who is shot.

GIRL OF THE GOLDEN WEST. Giacomo Puccini. New York, 1910.

Gold Fever Era, 1849–1850. *California, near Cloudy Mountains.*

Act I.—It is dusk in "The Polka," a miners' saloon and dance hall, where Jack Rance, the sheriff, sits smoking, and Nick, the bartender, lights the lamps. Miners troop in, calling for food and drink; they sing, dance, and play cards. Excitement runs high, when Minnie, the only girl in camp, enters, takes down a Bible and the miners gather about her, questioning and answering in turn. Minnie rejects Rance's attentions and presently he becomes jealous of Dick Johnson, who dances with her. Left alone with Dick, they avow their mutual love and she confides to him that she keeps the miners' gold. Act II.—Minnie returns to her lonely cabin, orders her table set for two, and arrays herself in all the finery in her possession. Johnson arrives shortly, amid a heavy snowstorm, which so increases in fury that he is obliged to remain. Soon a call is heard from the miners, who have come to warn her of Ramerrez, and she hides Johnson behind the bed curtains. They tell her Johnson is Ramerrez, and she affirms that he is not there and they depart. Contemptuously she orders Dick to come out and he confesses, but implores her pity. She sends him away, and immediately a pistol shot is heard. Opening the door, she finds Dick wounded; she puts him into the loft just as Rance appears to arrest him; again she denies his presence, but a drop of blood falling upon Rance's hand reveals the culprit. Rance proposes a game of poker, but Dick is unable to play and Minnie takes his place, the stakes to be her freedom and Johnson's against marriage with Rance and Johnson's surrender, from the two best games out of three. She pretends to faint and while Rance hunts for whiskey she stacks the cards from her stocking and wins. Act III.—Seated by a fire in a clearing in the forest, Rance awaits the return of the troops with Johnson, while preparations are made for the hanging. Soon they appear, and Johnson is bound and stood in the center of his accusers, who charge him with the intention of stealing their gold, but taking Minnie instead. The noose is ready, when Minnie rides into camp, dismounts and throws herself before Johnson, protecting him. Rance demands her removal and Johnson's life, but Minnie pleads so effectively, reminding them of her care of them and their gold, that they forgive her and release Johnson.

HANSEL AND GRETEL. Engelbert Humperdinck. Munich, 1893. *A German forest.*

Act I.—At home in a poverty-stricken room we find Hansel and Gretel making brooms and knitting stockings, while their parents are away seeking food. The children tease each other and play. Their mother, returning, finds little work done, and, in her rage, upsets a pitcher of milk, their supper. Further enraged, she sends them into the forest to pick strawberries, bidding them stay until they have filled the basket. Their father soon returns with food, and is greatly disturbed because they have been sent into the forest, where lives a witch who lures children with magic cakes, puts them into her oven, and when they are baked into German cakes devours them. Both parents hastily leave the house to find the children. Act II.—While Hansel hunts for berries, Gretel makes wreaths. They are afraid, they see specters and hear the echo as they call in vain for their parents. The Sandman appears, sprinkles sand in their eyes and they fall asleep praying, while angels surround them in accordance with their prayer. Act III.—When they awaken they discover the crunch witch's hut with a bake oven at one side and a cage connected with the house by a hedge of gingerbread men. Attracted by the smell, they begin to break off pieces of the hut and eat. Hansel is captured by the witch and thrust into the cage, while Gretel is sent into the house. On her return, Hansel warns her to be careful; when the witch asks Gretel to look into the oven, she asks how it is done. As the witch bends over, the children shove her into it and she is consumed. All the gingerbread figures become children and are released. Their parents find them and the witch is taken out of the oven as a huge piece of gingerbread.

THE HUGUENOTS. Giacomo Meyerbeer. Paris, 1836.

Paris and Touraine. The night of St. Bartholomew, 1572.

Act I.—Marguerite de Valois, betrothed to Henry IV., anxious to reconcile the Catholics and Huguenots of France by a marriage between Raoul de Nangis, a Protestant nobleman, and Valentine, daughter of Count St. Bris, a Catholic noble, invites Raoul to visit her in her palace. He is found with Count de Nevers, who is entertaining a party of Catholic friends. Each guest is requested to name his adored one, Raoul first. He declares that he loves an unknown one whom he

once rescued. A veiled lady appears just at this moment and Raoul recognizes his unknown heroine. She has come to ask De Nevers to release her from her promise to him and he does so. The note to Raoul is brought. Act II.—Marguerite receives Raoul and unfolds her plan of union with Valentine, as a sign of peace. When St. Bris introduces his daughter, Raoul refuses the alliance, believing that Valentine is the mistress of De Nevers. Act III.—Commanded by St. Bris, the troth is renewed between Valentine and De Nevers, who is plotting vengeance against Raoul, when he receives a challenge from him. Valentine, who has been in the chapel near by, overhears the scheme, and plans to save Raoul. Act IV.—The marriage has taken place but Valentine loves only Raoul, who, coming to say farewell, overhears that all the Huguenots are to be murdered that night; De Nevers refuses to take part in the plot, and is removed by St. Bris. Raoul tries to warn his friends, but is detained by Valentine, until he hears the signal for attack. Act V.—The leaders of the Huguenots are assembled when Raoul enters to tell them of the terrors of St. Bartholomew's night, and report the death of the leader; they arm themselves. De Nevers is dead; Valentine accepts Raoul's faith and they are married. Then the Huguenot women concealed in the church are murdered; a terrible scene of carnage follows in which Raoul becomes separated from Valentine, and they are not united until she finds him mortally wounded on the quay of Paris.

JEWELS OF THE MADONNA. Ermanno Wolf-Ferrari. *Modern Naples, the present.*

Act I.—Maliella, a beautiful and willful girl, was a parentless waif adopted by Carmela (in accordance with a vow made to the Virgin) when her son, Gennaro, lay at the point of death. Maliella was reared to think of Gennaro as her brother, but she chafes under the many restrictions placed upon her conduct by her foster mother and Gennaro. It is the festival of the Madonna, and Gennaro has made a wonderful wrought-iron candelabrum to be his votive offering to her. His prayers are interrupted by Maliella, who rushes into the garden followed by his mother, angry at some new phase of her willfulness. He chides the girl, who accuses him of jealousy, and to add to his discomfort pins on a paper hat, bursts into song, and invites the assembled youth, who join in her dance, to kiss her; they pursue her, pelting her with flowers. Soon they return, led by Biaso, who has been roughly treated by one of the Camorrists. Rafaele, a member of the band, follows Maliella, attempts to kiss her, and is jabbed with a long pin; he offers her a flower, which she spurns. In the fervor of his love-making, he even offers to procure the jewels which adorn the statue of the Madonna, and makes a movement towards the procession. She screams, and Gennaro asks the fellow's name, but she resents his interference. Rafaele drops the rejected flower and she picks it up. Act II.—That evening in the garden Gennaro tries to reason with her, but she grows defiant and tells him of Rafaele's daring offer. She threatens to leave and finally goes to her room, gathers her belongings, and returns to say farewell to Gennaro, who asks for a kiss and she offers her cheek. He reveals his love for her, which she repels. A frightful temptation overcomes Gennaro in his love, and, gathering up his keys and files, he sneaks out. Rafaele and his companions serenade Maliella, and, while Carmela tries to drive them away, Gennaro returns, looking like a ghost, to find Maliella standing by his empty tool box. Horror-stricken at his deed, he shows the jewels taken from the Madonna, and all run away except Maliella, who finally puts them on. Act III.—The Camorrists are asleep in their lair when Rafaele enters and sings of Maliella. She comes to show him the jewels and he spurns her; she hears Gennaro's voice outside and flings the jewels at him Terrified, they all flee but Gennaro, who, seeing a statue of the Madonna, crawls to it and stabs himself. The crowd return to seek him, but, finding him at the feet of the image, are awed into silence.

JONGLEUR DE NOTRE DAME (The Juggler of Our Lady). Jules Massenet. Paris, 1903.

Cluny, the fourteenth century

Act I.—In the market place Jean, the juggler, wanders hungry and miserable, but happy in his freedom, although unsuccessful in gaining audiences. He resorts to a parody upon the mass; a prior appears and he is about to be excommunicated, when he confesses his guilt and is received among the monks, relinquishing his freedom, tempted by the rich food of the abbey. Act II.—All the inmates of the abbey work for the feast of the Holy Mother, but Jean has no part, for he knows no Latin; he resolves to serve her in his own way. Act III.—Jean goes to the chapel, puts off his monastic garb, and, donning the juggler's dress, offers his songs and dances, his only gift, to the statue. So enrapt was he that the approach of the monks was unnoticed. The prior is about to stop him when a miracle occurs, the image raises its hands and places them in benediction upon Jean's head. The monks acclaim a saint: Jean, overcome with joy, dies.

KOENIGSKINDER (Children of the King). Engelbert Humperdinck. New York, 1910.

Legendary days, Hellabrun forest.

Act I.—It is summer in the forest near Hellabrun, where lives a famous Witch and her granddaughter, a Goose-Girl, who is sitting outside weaving a wreath, when the Witch calls her into the house to make bread, into which the Witch puts a poisonous powder. Left alone, the Goose-Girl tries to be happy, and, while looking into the water at her reflection, is surprised by a youth, who, impressed with her beauty, confesses he is the King's Son, and would take her with him. He offers a golden crown, but she refuses to wear it; he puts her wreath inside his tunic, they attempt to run into the woods, but are prevented by the magic all about. Then he goes alone, leaving the crown, which the Girl puts on the neck of the old gray goose. She is so excited when the Witch returns that she is suspected of neglect and finally confesses she has seen a man, which angers the Witch, who sends her into the house as the Fiddler and two friends appear. They have been sent by the councilors to find a real king. She tells them that the first person who enters the town gate after the clock has struck noon will be the king. The Fiddler, who has seen the Goose-Girl at the window, drags her out and she relates the story of her visit from the King's Son. Taking the crown from the goose's neck, she puts it on, declares she is free, and runs off with the Fiddler, followed by the geese. Act II.—The King's Son comes to the town gate, and is about to leave, when he sees a crowd of people approaching to see the King. The Senior Councilor begins a long speech, but is rudely interrupted by the Woodcutter, who relates his adventures in the magic wood. Speculations are rife as to the King's looks and his manner. At the eleventh stroke of the hour, the gates are opened and the Goose-Girl enters, followed by the Fiddler and her geese. She sees the King's Son and he calls her his Queen. The people crowd around and, mocking, drive them through the gates. Act III.—It is winter in the forest and the Fiddler is weary with hunting for the King's Children. The Woodcutter and his children, who live in the Witch's hut, are surprised to see the King's Son come, bearing the Goose-Girl in his arms, exhausted in their search for food. He wants to sell the crown, but she objects, and he exchanges it with the Woodcutter for a cake, which proves to be one of the poisoned ones belonging to the Witch. They wander off again, and when the Fiddler recognizes the crown, guided by the little gray dove, he hurries into the woods and finds the children dead. The Woodcutter's children construct a rude bier and place the King's Children upon it, covering them with a cloak, on which the Fiddler lays the golden crown.

LA BOHEME. Giacomo Puccini. Turin, 1896.

Paris, about 1830.

Act I.—Marcel, a painter, and Rudolf, a dramatist, are in dire straits, when their Bohemian friends come, bringing food, wine, and cigars. While they are feasting, the landlord asks for the rent, but they make him drunk, and put him out of the room; then they take the rent money for a carousal in the Quartier Latin, leaving Rudolf to his work. Mimi seeks him and they finally go out to supper. Act II.—While in a cafe, Musette, who formerly loved Rudolf, arrives with her rich admirer, Alcindor. Under pretense of suffering from a tight shoe, Musette sends Alcindor to the shoemaker's and joins her Bohemian friends at supper, for which they have no funds; she charges it to Alcindor, who returns with the shoe and is presented the bill. Act III.—Mimi, whom Rudolf has abandoned, seeks Marcel to tell him of her ill treatment, when Rudolf appears, and Mimi conceals herself; her coughing reveals her presence to the men, who have been discussing her health. Act IV.—Marcel and Rudolf are again at work in their garret when the Bohemians come for dinner, among them Musette, assisting the dying Mimi, whom they presently leave with Rudolf. The lovers are reconciled, and Mimi dies.

LA GIOCONDA. Amilcare Ponchielli. Milan, 1876.
Venice, seventeenth century.

Act I.—A festival is being held in the grand court of the ducal palace in Venice. Barnaba, a spy of the Inquisition, is scheming the ruin of Gioconda, a ballad singer. She appears with her blind mother as Barnaba declares that Zuane, the defeated boatman, is a victim of the witchcraft of the blind woman, and the people rush to kill her. Laura, wife of the inquisitor, enters, masked, and saves the blind woman, who gives her a rosary in gratitude. Laura discovers that Enzo, her former lover, is betrothed to Gioconda; Barnaba detects Enzo's love for Laura and proposes a meeting of the lovers on board his ship while Alvise, her husband, is away. Barnaba then sends a letter to Alvise telling of the elopement. Gioconda overhears and is heartbroken. Act II.—Gioconda hides herself on the ship and witnesses the meeting of the lovers. As Laura prays before retiring, Gioconda tells her of her husband's pursuit, and tries to stab her, but Laura holds up the rosary, which Gioconda recognizes, and, resolving to save Laura, places her in her own boat. Enzo, finding Laura has fled, sets fire to the ship. Act III.—Alvise determines Laura shall die by poison and, when she appears dressed for a ball, denounces her, shows her a funeral bier, and presents a bottle of poison. Gioconda substitutes a narcotic for the poison and Laura drinks it. Alvise's guests arrive, he greets them ceremoniously, but La Cieca tells them of Laura's death. Act IV.—Gioconda, alone in a deserted house on the canal, where two men have brought the lifeless Laura, asks their aid in finding her mother. Enzo arrives and is about to kill her when Laura calls to him. Gioconda helps them to escape, and returns to kill herself, as Barnaba comes to claim her. Barnaba in his rage tells of having strangled her mother, but Gioconda is dead.

LAKME. Leon Delibes. Paris, 1883.
An English possession in India, the present.

Act I.—Two young English officers, Gerald and Frederick, accompanied by the daughters of the Viceroy, enter a Hindu temple, and, while the others wander about in the sacred grove, Gerald remains to sketch. Lakme, who with her slave has been gathering flowers, returns to decorate the altar and there finds Gerald, with whom she falls in love. They are interrupted by Nilakantha, a Brahmin, who has a fanatical hatred for foreigners, and Gerald is driven away. Act II.—At the command of her father, who is in the crowd assembled in the market place, disguised as a beggar, Lakme sings accompanied by bells. Gerald approaches, and is stabbed by a priest and left for dead, but Lakme, finding signs of life, has him cared for by her servant, Hadji. Act III.—Lakme nurses Gerald in a hut in the jungle, and one day while she is searching for water he hears the voices of the soldiers and the music of the band; Frederick comes and reminds him of his duty as a soldier. Lakme discerns his wishes, and as they leave, poisons herself.

LA TOSCA. Giacomo Puccini. Rome, 1900.
Rome, about 1808.

Act I.—Angellotti, an escaped political offender, seeks refuge in the church of Sant' Andrea, where his sister, while praying, has unconsciously served as a model to the painter, Mario Cavaradossi, for his picture of the Magdalen. He secretes himself until the painter is alone, then they converse until interrupted by Tosca, a singer whom Mario loves. She jealously imagines that it is an intrigue with a woman when she sees the picture. Angellotti plans his escape in woman's dress, and flees, warned by a cannon shot. Scarpia, the chief of police, in search of the prisoner, finds Marchesa's fan and the empty basket as Tosca returns; he arouses her jealousy with them. Act II.—Scarpia awaits Tosca in the Farnese palace, whence his agent brings the artist, whom he questions and sends to the torture chamber. When Tosca arrives, her lover's sufferings are described and, harrowed by his groans, she reveals Angellotti's hiding place. Mario is released but denounces Tosca for her treachery. Drums announce Scarpia's defeat and Mario rejoices, for which he is imprisoned. Tosca attempts to follow, but is held back by Scarpia, who demands her virtue as the price of her lover's freedom. She struggles with him and finally, pretending to love him, secures a promise of Mario's release and safe conduct out of the country. After Scarpia has written the order, Tosca stabs him. Act III.—Mario in prison, awaiting execution, writes Tosca a farewell letter; she enters to tell him the news and the need of a mock execution, to which he agrees. The execution is real, however, and, as the soldiers denounce her as a murderess, realizing the truth, she leaps from the parapet of the castle and is dashed to pieces.

LA TRAVIATA. Giuseppe Verdi. Venice, 1853.
Paris and Nantes, about 1700.

Act I.—Violetta Valery forms the acquaintance of Alfred Germont and they live an idyllic life in the country until his father tells her that Alfred's and his sisters' futures have been ruined by her. Act II.—Deeply affected by this, Violetta leaves Alfred and plunges into wildest dissipation. Act III.—Alfred follows her and insults her, for which he is challenged, which makes Violetta ill. Act IV.—Alfred's father realizes that her love is sincere; Alfred, learning what she has sacrificed for him, begs her forgiveness and she dies in his arms.

LES CONTES D'HOFFMANN (Tales of Hoffmann). Jacques Offenbach. Paris, 1880.

The rich Lindorf loves the singer, Stella, who formerly had a love affair with the poet Hoffmann at Milan. Lindorff plans to make Hoffmann drunk and then show him to Stella to disgust her. Hoffmann is with his friends at the inn of Luther, which is in the same building with the theater where Stella is singing. Between the acts of the opera, Lindorf succeeds in his scheme and Hoffmann relates to his friends the story of his three love adventures with Olympia, Giuletta, and Antonie, each adventure requiring one act. The final scene shows the inn to which Lindorf has taken Stella to witness Hoffmann's degradation and so win her for himself. Act I.—Hoffmann falls in love with Olympia. Spalanzani, a mechanical genius, with the help of Coppelius, Olympia's lover, has constructed an automaton, which he exhibits to an astounded public as his daughter. Hoffmann becomes enraptured with the statue, writes an impassioned letter, appointing a meeting, which Olympia attends, but seems unrepsonsive to his love-making. Coppelius, having discovered the trick, revenges himself by telling Hoffmann the truth. Act II.—Giuletta entertains her many admirers, among them Schlemihl, who casts no shadow, and Hoffmann, who is madly in love with her. His enemy, Dapertutto, who owns Schlemihl's shadow, with the help of Giuletta acquires Hoffmann's. She beguiles the poet, and he barters his shadow for her love, but she breaks her word and leaves him to his enemies. Act III.—Antonie, daughter of Krespiel, inherited from her mother talent for singing, but her father forbids her to sing. When Hoffmann becomes her lover, the father disapproves because of his fondness for music. Dr. Mirakel, who had caused the death of Antonie's mother, obtains entrance to Krespiel's house, and a quarrel ensues. The doctor by some black art causes an apparition of the mother to appear and ask Antonie to sing. She does so and falls dead. Hoffmann lost his bride and Dr. Mirakel triumphed. Coppelius, Dapertutto, and Dr. Mirakel each represents Hoffmann's enemy, who takes away from him in turn his love. They are represented by one male and the maidens by one female singer, Hoffmann's character being the same throughout.

LOHENGRIN. Richard Wagner. Weimar, 1850.
On the Scheld, the tenth century.

Act I.—King Henry I. of Germany, living in Brabant, assembles the German tribes to expel the Hungarians from his dominions. Elsa has been accused of the murder of her brother, Gottfried, who has mysteriously disappeared. Elsa appears with her attendants and declares her innocence, willing to submit to the judgment of God and the ordeal of combat, choosing as her champion a knight of her dreams. Telramund, who made the accusation, incited by his wife, Ortrud, accepts the challenge for the king. At first the unknown knight is called in vain, but at the second attempt he appears on the river in a boat drawn by a swan, and clad in shining armor, lands, greets the king, and offers himself to Elsa as her champion on one condition, never to ask his name or origin. She agrees and in the combat following the knight is victorious. He declares her innocence and asks her hand in marriage. Act II.—Telramund and Ortrud were banished, but return in rags on the night before the wedding. Ortrud, who has magical power, schemes to induce Elsa to ask the forbidden questions. In the morning Lohengrin has been proclaimed "Guardian of Brabant." As the bridal party is about to enter the church, Ortrud accuses Lohengrin of being a magician, while Telramund claims that he was beaten by fraud, being ignorant of the name of his opponent. Lohengrin refuses to reveal his identity to any but Elsa, who assures him of her confidence. Act III.—In their bridal chamber Elsa, despite Lohengrin's warning, asks the

fatal question. Telramund rushes in to kill, but is killed by Lohengrin, who sorrowfully turns to Elsa and asks her to follow him to the king, to whom he will reveal the mystery. He does so as the troops appear and Telramund's corpse is brought in. Lohengrin is the knight of the Holy Grail. The time for his return has arrived, the swan reappears, and he says farewell; the swan dives into the river, coming up in the form of Gottfried. A dove descends from heaven, and leads Lohengrin back to the castle of the Holy Grail.

LOUISE. Gustave Charpentier. Paris, 1900.
Paris, the present.

Act I.—Louise, a sewing girl, is in love with Julian, an artist, but her mother objects to the match; they plan to get her father's consent, for which Julian writes a letter. Louise presents the letter at supper, her parents quarrel, and Louise finally promises to forget him. Act II.—It is early morning; men and women are on their way to labor, when Julian and some Bohemian companions arrive to run away with Louise when she comes to work escorted by her mother. Julian seeks Louise, and tells her his plans, but she will not consent. Later, in the workroom, Louise is jeered by the other girls for being so silent; Julian is heard singing in the street, begging Louise to come to him, and she cannot resist. Act III.—They go to a tiny house outside the city; at night the other Bohemians join them and dancing follows, Louise being crowned queen of them all. In the midst of this gayety, Louise's mother appears, full of sorrow, and the Bohemians depart. Louise is much frightened, for her mother announces the severe illness of the father, whom only the return of his daughter can cure. Julian relinquishes her on condition of her return. Act IV.—Her father's health is broken, and he reminds her constantly of her ingratitude. Growing defiant, Louise is ordered to bed. As she kisses her father good night, he takes her upon his knee and pleads with her to give up her life with Julian, and finally threatens her. She screams for Julian and her father bids her to go; he calls for her, but listens in vain.

LUCIA DI LAMMERMOOR. Gaetano Donizetti. Naples, 1835. *Scotland,* 1700.

Act I.—Lord Henry Ashton of Lammermoor has discovered that his sister Lucia is in love with Edgar of Ravenswood, his enemy. To prevent their marriage, he sends to Lucia a forged letter to prove Edgar's unfaithfulness, and informs her that only by a marriage with Lord Arthur Bucklaw can their ruin be averted. Act II.—Lucia's teacher, Raymond, persuades her to give up Edgar and the marriage preparations go on. Edgar tries to stop them and curses Lucia for her faithlessness. Act III.—Ashton and Edgar arrange a duel. The marriage takes place, but Lucia, frenzied by Edgar's charges and her own grief, slays Arthur in their chamber. Edgar awaits his enemy in the graveyard. He has heard of the murder and Lucia's insanity. Dying, she asks only for him. The bell tolls for the dead, and Edgar stabs himself.

MADAME BUTTERFLY. Giacomo Puccini. Milan, 1904. *Nagasaki, Japan, the present.*

Act I.—Cho-Cho-San (Madame Butterfly) and Lieut. Pinkerton, U.S.N., are about to enter into a Japanese marriage, which has been arranged by a marriage broker, Goro. Sharpless, the American consul, has begged Pinkerton to give up the plan, as the girl believes the marriage is binding, and has renounced her ancestral faith, which forbids her return to her people. An uncle, a religious fanatic, induces her relatives to abandon her and curses her, but Pinkerton consoles her and they are married. Act II.—Three years have passed, in which time Pinkerton returned to America, promising to return, but Susuki, the servant, suspects his perfidy. Sharpless has been commissioned to tell of Pinkerton's American marriage, a difficult task, because of the wife's faith. To settle all doubt she shows her fair-haired child, whom her husband cannot forget. As the consul departs, the guns announce the arrival of Pinkerton's ship, and preparations are made for his reception, Butterfly passing a sleepless night in watching. At dawn, still watching, she falls asleep. The men come later and tell Susuki the truth, who, violently angry at first, finally listens to the plan to give up the child. Butterfly appears, is confronted by the wife of Pinkerton, whom she calmly congratulates, when she learns the truth, and promises the child in a half hour's time. At the appointed time they find Cho-Cho-San dead by her own hand.

THE MAGIC FLUTE. Wolfgang Amadeus Mozart, Vienna, 1791.

Act I.—Sarastro, the wise priest of Isis, has taken Pamina to the temple to release her from the influence of her mother, the Queen of the Night, who induces the young Prince Tamino to search for her daughter and free her from the power of Sarastro. Tamino is pursued by a serpent in the forest and rescued by the attendants of the queen, although Papageno, a strange creature arrayed in the plumage of birds, claims the honor. Tamino is given a magic flute and Papageno a chime of bells with which to overcome all danger. Pamina is being persecuted by the Moor, Monastatos, in the palace of Sarastro, when Tamino arrives to rescue her, and the Moor takes to flight. The prince goes on to the temple, where he is refused entrance twice. Papageno, Pamina, and Tamino are about to escape, but the Moor prevents them as Sarastro appears. Pamina explains that she was trying to escape from the Moor, who is severely punished. Act II.—Tamino is led to the Temple of Ordeal, where, in order to possess Pamina, he must undergo the ordeal. The first test requires that the men shall remain silent under temptation. Three ladies tempt them to speak, but they are silent. While Pamina is asleep the Moor approaches and the Queen of Night gives him a dagger with which to kill Sarastro. Again they are tempted and Papageno speaks, but Tamino remains silent, making Pamina believe that he no longer loves her. Papageno wishes for a wife. Finally Tamino and Pamina pass through the ordeal of fire and water unscathed, with the help of the magic flute, and are united by Sarastro.

MANON LESCAUT. Giacomo Puccini. Milan, 1893. *Amiens, Paris, Havre, New Orleans, eighteenth century.*

Act I.—A crowd of men are gathered before an inn, while groups of students await the girls as they come from their work. Des Grieux does not join the others, for which he is teased. As Manon and Lescaut descend from the coach, all the students are enchanted, among them Des Grieux, who approaches her when her brother goes into the inn. On his return Geronte accompanies him and falls in love with Manon and plans to carry her off while her brother plays cards, but Edmund, a student, overhears the scheme and suggests that Des Grieux carry her off himself, which he does. Act II.—Manon deserts Des Grieux when his money is gone and goes to Geronte, whom she despises. Des Grieux appears suddenly and they renew their vows, but Geronte locks the doors, preventing their escape, and Manon is dragged off without Des Grieux. Act III.—Manon is cast into prison, and is to be deported to America; Lescaut and Des Grieux try to help her escape, but she is led to the ship followed by Des Grieux, who persuades the captain to take him aboard. Act IV.—Arriving in New Orleans, Manon is ill, and he leaves her to find some water. Fearing he has deserted her, when he returns she is beyond aid and dies in his arms.

MIGNON. Charles Louis Ambroise Thomas. Paris, 1866. *A small city; a castle in Italy; eighteenth century.*

Act I.—Just as the gypsy, Jarno, is about to force Mignon to dance by means of a whip in the courtyard of an inn, Wilhelm Meister appears and protects the girl, after having purchased her from the gypsies; she accompanies him dressed as a boy. They meet Laertes, the actor, with the coquettish Philine, and he warns Meister of her inconstancy, but he follows her nevertheless. Act II.—Accompanied by Mignon, Meister visits Philine in the castle of her uncle, and is compelled to bear her ridicule of the "boy." Mignon, when alone, dons Philine's clothes, but is discovered by Meister, who leaves her in distress. She continues in the park until she meets Lothario, the insane old singer, who calls down wrath upon the house, sets fire to the castle, from which Mignon is rescued by Meister. Act III.—Lothario is found to be Mignon's father, who, as a strolling singer, has been looking for his daughter stolen long before by the gypsies. Mignon finds love and happiness in her father and Meister.

OBERON. Karl Maria von Weber. London, 1826. *Fairyland.*

The elves are seen dancing about the sleeping Oberon, their King. Oberon has quarreled with Titania, his queen, who vows not to be reconciled with him until he shall find two lovers, constant to each other through trials and temptations. Puck believes he has found such a pair of lovers in Sir Huon of Bordeaux and Rezia, daughter of Haroun of Bagdad.

Sir Huon has killed the son of Charlemagne, and has been condemned to travel, and not return until he has slain Haroun's wicked councilor, Babekan, and won Rezia as his bride. He is presented with a magic horn, which, when sounded, will bring the forces of Fairyland to his aid. Thus armed he sets out upon his mission, accomplishes his purpose, carries off Rezia. Then Rezia and Huon are successively imprisoned, shipwrecked, sold as slaves, and condemned to be burned at the stake. In this desperate situation Huon sounds his horn, and Oberon and Titania come to his rescue. The King of the Fairies transports them to the court of Charlemagne. Huon is pardoned. Recognizing the constancy of Rezia and Huon, Titania and Oberon are reconciled.

PAGLIACCI (The Clowns). Ruggiero Leoncavallo, Milan, 1892.

Near Montalto in Calabria, August 15, 1865.

Act I.—The primitive theater of the village comedians has been erected and the actors parade in fantastic costumes, amid the good-natured raillery of the villagers. Canio declares that as a clown he will take part in any joke, but will resent any insult to his honor as a husband. Nedda, his wife, who is untrue to him, fears his threat. Tonio, having offended her, receives a blow from her whip, which angers him. Silvio and Nedda plan to elope, and Tonio, overhearing them, calls Canio, who pursues Silvio, but he escapes. Returning, Canio demands of Nedda her lover's name. Tonio whispers that the lover will attend the performance and can be detected. Act II.—The comedy begins and Nedda, collecting the money, warns Silvio. Canio, still jealous, demands the name of her lover, but she replies lightly and tries to escape; he seizes a knife and stabs her as Silvio comes to her aid and is recognized by Canio, who stabs him also.

PARSIFAL. Richard Wagner. Bayreuth, 1882.

Country and castle of Montsalvat and Klingsor's magic palace.

Act I.—Kept in ignorance of the world by his mother, Parsifal grows up "a guileless fool." His love of adventure is aroused by seeing a company of knights, and his mother finally allows him to go into the world. Amfortas, keeper of the Holy Grail, has succumbed to the arts of Kundry, contrary to his vow to refrain from the love of woman, and has been wounded by the enchanter Klingsor with his own lance, which fell from his hand and was grasped by Klingsor. It is the one which pierced the side of Christ on the cross, and was saved by Joseph together with the Grail, the vessel which caught the Redeemer's blood. Amfortas suffers agony but cannot be healed or die, until a "guileless fool, by compassion wise," brings back the lance and touches the wound. Kundry, the woman who scorned Christ on the cross, is condemned by Klingsor to wander the earth forever; she brings a healing potion to Gurnemanz, who tells of the magic garden created by Klingsor and peopled with beautiful maidens to seduce the knights. Parsifal, brought before Gurnemanz for wounding a swan within the precincts of the castle, is recognized as the "guileless fool" who can heal Amfortas. The miracle of the Grail is displayed, but Parsifal is so astounded that he forgets to ask the question which would release Amfortas, so is ejected from the castle. Act II.—Parsifal, confined in a dungeon beneath the turret, where Klingsor keeps his magic implements, is fully aroused by the combats in which he has conquered, when Klingsor causes the turret to vanish and a wonderful garden to appear, peopled with beautiful girls who surround him. He resists all but Kundry, who touches him by mentioning the death of his mother, and he kisses her; this excites the "guileless fool," and he understands what can be done for Amfortas. Horrified by Kundry's tale of her sin, he spurns her, and Klingsor tries to kill him with the holy lance, which remains suspended above his head; it is seized by Parsifal, who makes the sign of the cross, and Klingsor and his magic forces disappear. Act III.—After wandering for many years, Parsifal has gained wisdom and journeys once again to the castle of the Grail. Kundry has become the servant of Gurnemanz, who sees Parsifal's lance, and recognizes him. It is Good Friday. Amfortas, about to die, has assembled the knights and is ready to exhibit again the Holy Grail, when Parsifal enters and touches the wound with his lance, healing the king. Reverently holding aloft the Grail he proclaims himself the king, to whom all bow in loud homage.

PELLEAS AND MELISANDE. Claude Debussy. Paris, 1902.

Act I.—Golaud, a mighty hunter, is lost in a forest. He hears a sound of weeping and discovers Mélisande, for whom he seeks shelter. Act II.—A letter from Golaud, announces his marriage to Mélisande and asks for her acceptance at the castle, a light in the window to be the sign of their favor. The old king, Arkel, sanctions the marriage and the couple come to the castle, where Mélisande meets Pelléas, Golaud's brother. Seated near the fountain with Pelléas, Mélisande takes off her wedding ring and accidentally drops it into the water, where it is lost. She is terribly frightened about what to say to Goland, but Pelléas advises her to tell the truth. Golaud is injured by a fall from his horse; taking Mélisande's hand as she ministers to him, he discovers the loss, and she tells him that she dropped it in a cave by the sea trying to escape the tide. He bids her go at once and find it, taking Pelléas with her. Act III.—Pelléas is going away and seeks Mélisande to say farewell; overcome by emotion he kisses her passionately, Golaud finds them, and upbraids them for their folly. Act IV.—Pelléas is advised by his grandfather to leave the castle at once. Golaud, whose jealousy has been aroused by Mélisande's sorrowful mood, seizes and almost chokes her with her hair. Arkel interferes and Golaud departs angrily. Breathless from her encounter, Mélisande seeks Pelléas to say good-bye, and they declare their love for each other. Golaud witnesses their embraces and kills Pelléas. Act V.—Mélisande, dying, grants forgiveness to the penitent Golaud, and avows her love for Pelléas.

PRINCE IGOR. Alexander Borodin.

St. Petersburg, 1690.

Prologue. Square in Poutivelo. Prince Igor and his expedition are about to depart for battle with an Oriental tribe. An eclipse occurs, which overawes the people, but Igor does not heed the warnings of his wife, and departs with his son Vladimir, after entrusting his wife to his brother, Prince Galitzky. Act I shows feasting and carousing in the courtyard of Prince Galitzky's house. The Princess broods over the absence of her husband. A delegation of Boyars appear to tell that Igor has been wounded and is a prisoner, with his son, in the enemy's camp. Prince Galitzky betrays his trust, and stirs up rebellion. Distant flames are seen and the people cry that the enemy is advancing. Act II reveals an evening scene in the enemy's camp, where Igor and Vladimir are prisoners. A chorus of girls is singing, among them the daughter of Kontchak, the Oriental chief. Prince Vladimir has fallen in love with her. Igor appears and Kontchak offers him his freedom if he will agree never to fight again. The act ends with a dance of the slaves. Act III shows another part of the enemy camp where the Orientals' triumph over the Russians is being celebrated. Kontchak lets Igor escape, and orders his soldiers not to shoot or pursue. Act IV.—The public square at Poutivelo. Prince Igor returns, embraces his wife and restores order. The townspeople are assembled by the ringing of the town bell, and greet their king with great rejoicing.

RIGOLETTO. Giuseppe Verdi. Venice, 1851.

Mantua and vicinity, the sixteenth century.

Act I.—The prince of Mantua has seen an unknown beauty in church and desires to possess her, although paying court to the Countess Ceprano. His jester, Rigoletto, mocks the ladies of the court and suggests their removal. The noblemen vow vengeance upon Rigoletto, and Count Monterone curses both the prince and jester. Act II.—Thinking of the curse, Rigoletto returns home to his daughter, Gilda, who is forbidden to appear except at church. She does not know her father's occupation. In the guise of a student the prince appears after Rigoletto departs, and is seen there by the noblemen, who finally abduct Gilda. They tell Rigoletto that they have abducted the Countess Ceprano and secure his assistance; he realizes his deception and remembers the curse. Act III.—The prince hears of the abduction from the noblemen, who say Gilda is Rigoletto's mistress and that she is in the castle. Rigoletto, taunted by the noblemen, finally acknowledges that she is his daughter, and is taken to her. She admits her love for the prince, and Rigoletto vows vengeance against his master. Act IV.—Gilda and Rigoletto go to the house of the bandit, and find the prince amusing himself with Maddalena, his daughter, and the jester bargains with the bandit to kill the prince. Gilda is forced by her father to don male attire and go to Verona, but fearing an attack on the prince returns to overhear the bandit promise his daughter, who begs for the life of the prince, that if by midnight another can be found to take the prince's place, he will spare his life. The

prince is kept in the house by a severe storm. When Rigoletto arrives with the money, he receives a bag containing a corpse; he is about to cast the bag into the river when he hears the prince's voice. On opening the wrappings he finds the body of his daughter. The curse had been fulfilled.

THE RING OF THE NIBELUNG. Richard Wagner. Munich, 1869.

Introduction—**THE RHEINGOLD.** Three Rhine daughters, Woglinde, Wellgunde, and Flosshilde, are swimming about at the bottom of the river when the dwarf, Alberich, tries to catch them. The brilliant sun reveals the Rheingold, guarded by the daughters, and despite their father's warning they tell Alberich that "he who can fashion a ring from it and possess it will own the world and all its mighty power," but that the person must care nothing for love, else he cannot fashion the ring. Alberich laughingly snatches the Rheingold and disappears. He makes a ring, whose fame reaches the home of the gods, Walhalla and Wotan. The giants have built Walhalla and their reward is to be the goddess of youth, Freya, the sister of Fricka, Wotan's wife. Wotan plans to kill the dwarf and secure the ring, which he will give the giants instead of Freya. Alberich, with the aid of the ring, has brought all Nibelungs under his power and drives them to slavish tasks. His brother Mime has made him a magic helmet, which renders him invisible besides changing his form to anything he desires. Wotan and Loge, god of fire, visit the dwarf and obtain the secret of the helmet, whose power they doubt. Alberich, to show proof of it, changes himself into a dragon and then into a toad, which Wotan crushes under foot as Loge grasps the helmet, and they carry Alberich to the upper world, where they compel him to give up the treasure also; he curses them and declares it will bring death to whosoever wears the ring. The giants return and receive the gold and helmet, but Wotan refuses to surrender the ring until frightened by the warnings of Erda, goddess of the earth. Then Freya is freed. The giants quarrel over the ring and one is killed. Wotan leads the gods to Walhalla upon the rainbow and resolves to obtain the secret of the Götterdämmerung. The first day—**THE WALKURE.** Wotan has learned from Erda that the gods will perish if Alberich again obtains the ring. The Walküre are the offspring of the love of Wotan and Erda; they are the shield maidens who lead the heroes to Walhalla to battle for the future of the world. To secure the ring Wotan, as he cannot take it from the giants, descends to earth and founds the Walsungs, from whom the hero will be produced. Siegmund, son of Wotan, weaponless rushes into the hut of Hunding, and is there tended by the latter's wife, Sieglinde. On her husband's return he recognizes his enemy but cannot touch him in his own house. When Hunding retires, Sieglinde gives him a sleeping potion, and shows Siegmund the sword sticking in the tree, which was left there by Wotan at her wedding feast, and tells him it will belong to the man who succeeds in withdrawing it. Siegmund draws the sword and she recognizes him as her twin brother. They flee into the forest. Brunhilde, Wotan's favorite shield maiden, is commanded to protect the Walsung in the fight between Siegmund and Hunding, but Fricka commands that the victory shall be Hunding's to punish Siegmund for taking his sister away. Brunhilde does not obey, but Wotan aids Hunding and the sword is broken in two; Siegmund is slain, but Brunhilde is pursued by Wotan, who kills Hunding. Brunhilde joins the other Walküre, and awaits Wotan, who causes her to fall into a magic sleep, and decrees that she shall belong to him who shall awake her with a kiss. He causes flames to surround the peak so only the most fearless knight could penetrate. Second day—**SIEGFRIED.** The son of Sieglinde, born in the forest. At her death she gave him and the two pieces of his father's sword into the keeping of Mime, the smith. He tried in vain to join the pieces of the sword, hoping that Siegfried, who has great strength, may slay the fierce dragon, Fafner, guarding the treasure received from Wotan. Siegfried questions about his origin and Mime refuses to answer until almost strangled, then tells him of his parentage and shows him the broken sword. Wotan appears in disguise and wagers with Mime that he can answer three questions satisfactorily, the stake to be Mime's head, and also requires an answer to three questions or forfeit his own head. Mime answers two, but cannot tell who will mend the sword. Wotan says that one who has never known fear can accomplish it. Siegfried returns, joins the parts, and produces a powerful sword; then Mime sends him to kill Fafner. Alberich is waiting near the cave to kill the slayer of Fafner, when Siegfried appears with Mime and kills the dragon, whose blood upon his fingers gives him magic power, and he takes the magic helmet and ring. He is enabled to read Mime's mind and slays him. A bird sings to him of the maiden on Valkyr's rock, and, led by it, he proceeds to rescue Brunhilde. He is met by Wotan, whose spear he splinters with his sword, and springs through flames to the rock, where he awakens Brunhilde with a kiss. Third day—**GOTTERDAMMERUNG.** Wotan seated in Walhalla, waiting the end he has predicted, orders a spear to be constructed to displace the one Siegfried destroyed. Loge is to set fire to Walhalla when God and the world have been freed from the curse of the ring and the Rheingold has been returned to the Rhine maidens. Siegfried comes from the forest with Brunhilde, who has instructed him in the wisdom of the gods; he gives her the ring as a love token, and she presents him with her steed, Grane, that he may go forth into the world to perform deeds of valor. Hagen, son of Alberich, is the avenger who is to slay Siegfried and obtain the ring. When Siegfried arrives at Hagen's home he is hospitably entertained and given a potion which causes him to forget Brunhilde; he wooes Gutrune and, drinking blood brotherhood, joins Gunther, her brother, in the adventure to win Brunhilde. Siegfried, in the guise of Gunther, approaches Brunhilde, takes the ring from her hand, and leads her away to Gunther, where she sees Siegfried united to Gutrune and the ring upon his finger. She has been united to Gunther, and filled with a frenzy of jealousy, joins Hagen to murder Siegfried. The latter is besieged by the Rhine maidens for the ring, and they predict his death. He drinks wine at Hagen's banquet, his memory immediately returns, and he relates his rescue of Brunhilde, and their love. Hagen stabs him in the back and he dies, his body is carried to Gutrune. Hagen demands the ring from Gunther, who refuses to give it up. Siegfried's body is placed upon the funeral pyre and Brunhilde applies the torch, after taking the ring from his finger, when she mounts her horse and ascends the flames which the Rhine rises above; the maidens grasp the ring, and Hagen is dragged to the depths. A great light appearing in the distance denotes the destruction of Walhalla, "the twilight of the gods."

SALOME. Richard Strauss. Dresden, 1905.
Palace of Herod, A.D. 30.

Salome lives at the sensual and cruel court of Herod, her stepfather. Still a maiden, she has conceived a strong passion for the Prophet Yochanaan, who has been thrown into a cistern near the palace by Herod. Salome orders the prophet to be brought to her by the young Syrian commander, Narraboth, who is so insanely infatuated with her that he obeys her commands against the orders of the king. When he discovers Salome's ardor for the prophet, he kills himself before her, which she scarcely notices. Yochanaan repulses her and returns to prison; she becomes half crazed with passion. Herod wishes to see her dance and she takes advantage of this to extort from him the promise of reward, which he gives without any conditions. Scantily clad, she dances alluringly before him and then demands the head of the prophet. Herod, afraid to slay this prophet of God lest the people revolt, offers half his kingdom if she will withdraw. She refuses, and demands the head of the Baptist, until Herod orders his execution. His head is brought to her in proof of his death, and as she kisses the pallid lips again and again, Herod in disgust orders her death, the infuriated soldiers crushing her with their shields.

SAMSON AND DELILAH. Camille Saint-Saens. Weimar, 1877. *Gaza in Palestine,* 1150 *B. C.*

Act I.—The Israelites are in revolt against the oppression of the Philistines and pray for relief. Samson, their leader, is filled with the hope of victory although scoffed at by Abimelech, the satrap, who in attempting to repress them is killed by Samson, whom the Philistines fear to arrest. The Israelites, taking courage, drive the Philistines away. Delilah and her maids greet Samson, the leader, and he is unable to withstand her charms. Act II.—The high priest has commanded Delilah to deliver the hero to the Philistines and she awaits Samson in her home, with vengeance in her heart, as he has deserted her once. When he appears she so bewitches him that he tells her his secret of strength is in his hair. She lulls him to sleep, cuts off his hair, and calls in the Philistines, who over-

power him, as his strength has gone. Act III.—Weak, blind, and imprisoned, he is filled with remorse as he hears the reproaches of his people. He is dragged out to be shown as a captive in the triumphal procession, taken to the temple, and ordered to sing in praise of Delilah, but he prays to the Lord to give him strength and vision, as the enemy mock him and the tumult increases. He continues praying and, grasping the two marble pillars of the temple, bends them and with his enemies finds death among the ruins.

THE SECRET OF SUZANNE. Ermanno Wolf-Ferrari. Munich, 1909. *The present.*

Count Gil and Countess Suzanne have recently been married, but the youthful bride has not dared to tell her husband that she smokes cigarettes, lest he disapprove and scold her, so she is obliged to smoke whenever a good opportunity is offered He observes the odor of smoke about the house and his jealousy is aroused. Not dreaming that she is the culprit, he fears that she has a lover whom she is hiding. His accusations drive her to all sorts of absurd excuses, which seem to confirm his suspicions. At last Count Gil feels that he must know the truth. He follows the supposed lover from room to room, sniffing the tobacco smoke as he goes. When he finally believes he has trapped the lover, he finds his pretty little wife smoking. She looks so charming when engaged in her pet vice, he is so relieved to find he is the only lover, that he forgives her and peace is restored.

TANNHAUSER. Richard Wagner. Dresden, 1845. *Thuringia and the Wartburg, the thirteenth century.*

Act I.—The goddess Venus has won the dreaming Tannhäuser by her fascinations, but he soon longs for freedom, though she tries to hold him. At the mention of Mary, the Mother of God, the spell is broken, Venus and her attendants disappear, and he finds himself in the Wartburg just below, where a young shepherd sits playing. As the pilgrims pass, Tannhäuser, sobbing, sinks to his knees. The landgrave and his companions Wolfram, Walter, Biterolf, Reimar, and Heinrich find him and are rejoiced, for they have missed him. He had fled because unsuccessful in the prize singing. When the huntsmen tell him that he has gained Elizabeth's heart with his singing, he joins them. Act II.—Another contest is to be held in the hall of the Wartburg. Elizabeth has been in retirement since Tannhäuser's disappearance, but promises to be present if he returns; she is there to greet him when he comes. The subject of the day is "Love's Awakening." Elizabeth is to grant a wish to the victor, whatever it may be. Wolfram begins, declaring love is a pure stream which should never be troubled. Tannhäuser replies to all in turn and finally sings a song of love to Venus, shocks the ladies and the knights draw their swords upon him. Elizabeth protects him and he is allowed to join a band of pilgrims to Rome to seek forgiveness. Act III.—The pilgrims return with no news of Tannhäuser for Elizabeth, who returns broken-hearted to the Wartburg. Wolfram has a vision, in which a tottering pilgrim is seeking the path to Venus; it is Tannhäuser who is unforgiven by the pope. Calling for Venus, who appears and beckons him to her cavern, his attention is drawn to a procession chanting and carrying a bier, on which is Elizabeth's body. He kneels beside it and prays. The withered stick put forth young leaves, a sign of the forgiveness of God.

THAIS. Jules Massenet. Paris, 1894. *Thebes and the Theban desert, Egypt, during Greek occupation.*

Act I.—Athanael, a monk of the Cenobite Order, has been in Alexandria to denounce the luxury and license of the Greeks, but returns to report that the city is under the rule of Thaïs, a beautiful courtesan. In his dreams that night he sees her half clad posing before the people as Aphrodite, and he awakens, condemning her aloud. Again he departs upon his mission and on reaching the city goes to see Nicias, whom he finds infatuated with Thaïs, though she has ruined him. The monk is invited to remain for a banquet, at which Thaïs will be present. Slaves array the monk in gorgeous apparel. Thaïs soon appears, surrounded by an adoring crowd, and presently discovers Athanael and asks his name and business. He tries to explain his mission, but she only exerts her charms the more; he denounces her and finally goes away horror-stricken. Act II.—Accompanied by her friends, Thaïs returns home dispirited and tired. Athanael watches her as she gazes into her mirror with delight, and prepares some incense as she sings to Venus. He tells her that he loves her with the love of the spirit, and commands her to follow him but she hears the voice of Nicias, and turns from the monk, who tells her he will wait until day and lies down outside on the pavement. Alone she falls into a reverie then slowly appears, bearing a lamp, and tells Athanael that she is ready to go with him. Nicias and friends appear and call for dances, but Thaïs, clad in a simple robe of white, follows the monk, bearing the flaming torch. Her slaves follow, as flames devour the house behind them. Act III.—Thaïs and Athanael have almost reached the convent in the desert when her strength gives out and he helps her to the abbess, when they say farewell. Athanael returns to his dwelling, where he confides to Palemon his love for the beautiful woman. A vision of Thaïs dying so overcomes him that he rushes into the desert, where a storm is fiercely raging. Act IV.—In the garden of the convent Thaïs lies dying as the nuns kneel about her, when Athanael enters and asks for her. Left alone, he tells her of his love, but, rising, she points to the sky, where she sees angels approaching to bear her away. She calls on God and falls dead at his feet. Overcome with anguish, he sinks to the ground beside her.

TRISTAN AND ISOLDE. Richard Wagner. Munich, 1865. *On board ship, in Cornwall and in Brittany.*

Act I.—Tristan has been sent by King Mark to bring his intended bride, Isolde, from Ireland to Cornwall. She has recognized in him the wounded knight she once nursed but who slew her betrothed in combat. She resolves to kill him and orders her servant to prepare a poisoned potion for him. By mistake she is given a love potion, which they both drink and finally sink into each other's arms in an ecstasy of love. Act II.—When they reach King Mark's castle, they plan to meet in secret, but she is warned by her servant against the jealous Melot. Tristan is also warned, but it is too late, for he is closely watched by Melot, the king, and attendants. The king, however, despises Melot for his treachery; Tristan is injured in the combat which follows. Act III.—Taken to his own home, Tristan grows rapidly worse and his servant sends for Isolde to heal him. When she comes, Tristan rushes to her and dies in her arms. The king has also come to unite the lovers, but Kurwenal thinks he has evil intent and kills Melot. Isolde dies of grief beside Tristan and the king remains in prayer beside them.

LANDMARKS IN THE HISTORY OF MUSIC

333 St. Ambrose born.

384 Ambrosian chant arranged for Milan Cathedral.

590 Accession of Pope Gregory, who assembled and arranged the Gregorian chant.

814 Chant of Metz, Germany, began to be introduced into all Catholic churches at matins.

895–900 Two distinct melodies, in parallel fourths, called *Organum*, first recorded. Hucbald, a monk, was long considered the inventor. This is now disputed.

1025? The use of neumes and the introduction of the solfeggio by Guido of Arezzo. The 4-line staff first used.

1100 Beginning of the earliest French school of contrapuntalists. Perotin introduces "imitations."

1200 Franco of Cologne introduced his book on "measured music" called *Ars Cantus Mensurabilis.*

1217 Walter Odington, an English disciple of the French school, wrote a treatise on music.

1380 Introduction of secular tunes in masses.

1425 Birth of Johannes Okeghem, first master of the great Netherland school. Called the "patriarch of counterpoint." He brought the canon to a high degree of perfection.

Bellini's *La Sonnambula* produced.
1842 Wagner's *Rienzi* produced.
1843 Ole Bull, famous Norwegian violinist toured America.
1845 Wagner's *Tannhäauser* produced.
1846 Mendelssohn's *Elijah* produced at the Birmingham Festival.
1850 Wagner's *Lohengrin* produced.
1851 Verdi's *Rigoletto* produced.
1859 Gounod's *Faust* produced.
1862 Debussy born.
1864 Richard Strauss born.
1868 Wagner's *Die Meistersinger* produced.
1876 Wagner's *Der Ring der Nibelungen* produced.
1887 Verdi's *Otello* produced.
1882 Igor Stravinsky born.
1883 Wagner's *Parsifal* produced.
1890 Mascagni's *Cavalleria Rusticana* produced.
1891 Tschaikovski visited America to conduct his own works.
1892 Leoncavallo's *I Pagliacci* received its premiere.
1892 Dvorák came to America, and composed his *From the New World* Symphony.
1893 *The New World Symphony* of Dvorák first performed.
1896 Puccini's *La Bohème* was produced.
1897 Erich Korngold born.
1900 Gustav Charpentier's great opera *Louise* produced.
1902 Debussy's *Pelléas et Mélisande* was produced at the Opera Comique, Paris.
1902 Pietro Mascagni toured America.
1903 Enrico Caruso, famous Italian tenor (1873–1921), came to the Metropolitan Opera House, New York, as leading Italian singer.
1904 Puccini's *Madame Butterfly* first produced.
1905 Strauss's *Salome* was produced.
1905 The famous *Mountain Symphony* of d'Indy first performed.
1906 Edward Elgar, greatest English composer, visited America.
1906 Leoncavallo visited America.
1907 Gustav Mahler, famous conductor, came to the United States. Became conductor of N. Y. Philharmonic in 1909.
1908 Mahler's 7th and greatest symphony produced at Prague.
1910 Alfredo Casella's rhapsody *Italia* a fore-runner of the later barbaric style first performed.
1910 Puccini came to the United States.
1912 Arthur Nikisch, famous Hungarian conductor, toured the United States with the London Symphony Orchestra.
1912 Wolf-Ferrari's *The Jewels of the Madonna*, one of the greatest operas since Wagner, first performed. He visited America.
1913 Stravinsky's *Le Sacre du Printemps* (Rite of Spring) first performed.
1913 Italo Montemezzi's opera *L'Amore Dei Tre Re* produced.
1915 Saint-Saëns visited America.
1919 Montemezzi's *La Nave* produced. He visited America.
1920 Vaughn-Williams' *London Symphony* produced.
1921 Richard Strauss visited America.
1921 Stravinsky's *Rite of Spring* given its first American hearing.
1924 Respighi's great symphonic poem *The Pines of Rome* produced.
1924 Zandonai's opera *I Cavalieri di Ekebu* produced.

DICTIONARY OF MUSICAL TERMS

A CAPPELLA (*ä käp-pĕl'lä*). Unaccompanied choral singing.
A CAPRICCIO (*ä kä-prĕt'chō*). In a capricious manner.
ACCELERANDO (*ät-shel-er-an'dō*). Increasing in speed.
ACCENT. Emphasis upon a given note.
ACCESSORY NOTES. Embellishing notes, usually printed very small and placed one degree above or below their principal note.
ACCIDENTALS. Sharps, flats, double sharps, double flats and naturals, not found in the signature.
ACCOMPANIMENT. A subordinate instrumental or vocal part, added to the principal part to enhance and enrich the combined effect.
ADAGIO (*ä-dä'jō*). Slow, leisurely.
AD LIBITUM (*äd lĭb'ĭ-tŭm*). At pleasure, according to your own conception.
AEOLIAN. One of the Greek scales.
AGITATO (*ä-jē-tä'tō*). In an agitated, restless manner.
AIR. The melody, or tune.
ALLARGANDO (*äl-lär-gän'dō*). In a dragging manner, broader.
ALLEGRETTO (*äl-lā-grĕt'tō*). Fairly fast, a diminutive form of allegro.
ALLEGRO (*äl-lā'grō*). Lively, brightly.
ALTO. High, used formerly to refer to the highest male voice; now the lowest female voice.
ANDANTE (*än-dän'tā*). Moderately, flowing along.
ANIMATO (*ä-nē-mä'tō*). In an animated manner, full of spirit.
ANTHEM. A vocal composition, the words of which are taken from the Scriptures. May be accompanied or unaccompanied.
A POCO (*ä pō'kō*). Little at a time, gradually.
APPASSIONATO (*äp-päs-syō-nä'tō*). With deep feeling, intense, passionately.
ARIA. A melody, usually taken from an opera, intended as a display piece, for a single voice.
ARPEGGIO (*är-pĕd'jō*). In harp style, referring to the playing of chord tones in succession, instead of simultaneously.
ASSAI (*äs-sī'*). Very.
A TEMPO. In time, resuming the tempo after deviation from it.
ATTACK. The precision with which a beginning note is sounded.
AUTHENTIC CADENCE. The closing group of chords, called dominant and tonic, expressing complete finality.

BALLAD. A song in dance rhythm, a simple romantic song, descriptive or narrative in style. An instrumental composition in ballad style.
BAND. Any group of players performing together, as string band, brass band, military band.

BARITONE. The male voice lying between the bass and tenor. It refers also to an instrument between bass and tenor.
BASS. The lowest part of a composition, the lowest male voice, lowest instrument of a family of instruments.
BATON. The stick used by a conductor in beating time.
BEAT. Each unit of time in a given measure, each movement of the conductor's arm when beating time.
BEN (*bĕn*). Well, as *ben marcato*, well marked.
BERCEUSE (*bĕr-sûz'*). A cradle song.
BOLERO. A Spanish dance accompanied by castenets. It is in triple time.
BRILLIANTE (*brĕl-län'tā*). In a brilliant manner.
BUFFA. In a comic style.

CADENCE. A group of closing chords. Cadences are said to be Perfect when they express complete finality. They are imperfect if the effect is of less force and completeness.
CADENZA (*kȧ-dĕnt sȧ*). An elaborate ornamental passage.
CALMATO (*käl-mä'tō*). Tranquilly.
CANON. Actually means, rule or regulation. A composition in the contrapuntal style, using the idea of imitation. That is, the melody, after being enunciated by the first voice is imitated after a given number of beats by a second, third, and fourth voice.
CANTABILE (*kän-tä'bĕl-lā*). In a singing style, lyrical.
CANTATA. A large choral work, resembling oratorio. May be religious or secular in character.
CAPO (*kä'pō*). Head, beginning.
CAPRICE. A short composition, free and unconventional in style.
CARILLON. A set of bells upon which a melody can be played.
CHAMBER MUSIC. Instrumental music in the sonata form, for a small group of string or woodwind players with, or without, piano.
CHANT. A sacred song.
CHOIR. A group of singers. A group of instruments of the same character, as for instance, the string choir.
CHROMATIC. Progression by semi-tone. Containing tones not in the diatonic scale.
CODA (*kō'dȧ*). The closing section. The general summing up of the movement or composition. The final episode of a fugue.
COLORATURE. Florid, ornamental type of music, vocally brilliant.
CONCERTMEISTER. Concert master, the leader of the first violins, next in rank to the conductor.
CONSONANCE. Sounds in agreement, the opposite of discord.
CON (*kŏn*). With.
CONTRA (*kŏn'trȧ*). Meaning an octave below.
COUNTERPOINT. The art of adding two or more melodies together.
CRESCENDO (*krĕ-shĕn'dō*). Getting louder.
CZARDAS (*chär'dȧsh*). Hungarian national dance.

DA (*dȧ*). From, as Da capo, from the beginning.
DECRESCENDO (*dā-krĕ-shĭn'dō*). Decreasing in loudness.
DEVELOPMENT. The working out of a motive or melody, harmonically, rhythmically.
DIATONIC. Refers to the major and minor scales of eight tones.
DIMINUENDO. Gradually getting softer.
DISCORD. A combination of tones which is unpleasant to the ear.
DOLCE (*dōl'chā*). Sweet.
DOMINANT. Theoretical name for the fifth scale-step.
DORIAN. One of the Greek scales.
DYNAMICS. Treats of the elements of force, loudness and softness, and their different degrees.

ELEGY. A mournful composition.
ENHARMONIC. Writing the same sound two different ways, as, for instance *b flat* and *a sharp*.
ENSEMBLE. The manner in which voices or instruments blend into "Oneness" in the performance.
EROICA (*ĕ-rō'ĕ-kä*). Heroic.
ESPRESSIVO (*ĕs-prĕs-sĕ'vō*). In an expressive manner.
ETUDE. A study, a composition written for the advancement of some technical growth.

FANDANGO (*fȧn-dȧng'gō*). A very old Spanish dance, in lively triple time.
FORM. The design of a musical composition.
FORTE (*fôr'tā*). Loud.
FORZANDO (*fôr-tsän'dō*). Literally, forced. Sudden emphasis upon a given note or chord.
FUGUE (*fūg*). A contrapuntal form of composition, in which the theme, or subject, is artfully imitated by successive voices, and interwoven and developed with the other parts.

GALOP. A lively dance in 2–4 time.
GAVOTTE (*gȧ-vŏt'*). A rustic dance of the court of France in the 16th century. Duple time, rather quick.
GIGUE (*zhēg*). A jig, a lively dance.
GIOCOSO (*jō-kō'sō*). In a joking manner, sportive.
GIUSTO (*jōōs'tō*). Exact.
GRANDIOSO (*grän-dē-ō'sō*). Noble, in a grand manner.
GREGORIAN CHANT. A style of church music without definite rhythm, written in one of the Ecclesiastical Modes, attributed to Pope Gregory.

HARMONY. A combination of tones, which will sound well together when sounded simultaneously. In a larger sense it refers to the entire succession of such combinations, (chords) as found in a composition.
HYMN. A song composed for congregational singing in church services.

IMPROMPTU. A short composition written in the free style of extemporaneous improvisation.
INTERVAL. The difference in pitch between two tones.
IONIAN. One of the Greek scales.

KEYNOTE. The initial tone of a scale, the fundamental basis of the key.
LARGO (*lär'gō*). Slow, broad. Very deliberate.
LEGATO (*lā-gä'tō*). Connected, not in the slightest degree detached.
LEITMOTIF (*līt'mō-tēf*). German for leading motive. A musical motive or fragment, which labels a given person, situation or condition, recurring each time the person, situation or condition is presented or even hinted at, in the music dramas of Wagner and his followers.
LENTO (*lĕn'tō*). Slow.
LIED (*lēt*). German for song.
LULLABY. A cradle song.

MADRIGAL. A song for three to eight voices, unaccompanied, in the style of imitative counterpoint, perfected in the middle of the 15th century, in the Netherland School.
MAESTOSO (*mä-ĕs-tō'sō*). Majestic.
MARCATO (*mär-kä'tō*). Marked, accented.
MAZURKA (*mȧ-zōōr'kȧ*). A Polish national dance in triple time, with a strong emphasis upon the third beat of each measure.
MEZZO (*mĕd'zō*). Medium, half.
MINUET. A slow graceful dance in triple time.
MODULATION. The theoretical term for a change of key.
MOLTO (*mōl'tō*). Much.
MONODY. One part music.
MOTIVE. A musical figure or fragment, which serves as the germ for the development of a complete musical idea, or even an entire composition.
MUTE. A small clamp, attached to the bridge of a stringed instrument to muffle its tone. A pear-shaped pad inserted into the bell of a wind instrument for the same purpose. The sign is *Con sordino*.

NOCTURNE. An evening song.

OBBLIGATO (*ŏb-blē-gä'tō*). An obligatory accompaniment or part. One which cannot be dispensed with.
OPERA. A drama set to music, performed with the aid of costumes, scenery, and action.
OPERETTA. An opera in a light vein, usually comic.
ORATORIO. A drama, with a text taken from the Bible, performed without scenery, costumes or action.
OVERTURE. An introductory piece of music, used in connection with an opera, oratorio or other large composition.

PASSIONATO (*päs-syō-nä'tō*). Passionate.
PASSION MUSIC. A cantata, or oratorio, the text of which treats of the suffering and death of Christ.
PENTATONIC SCALE. A scale of five tones, comparable to our major scale with the 4th and 7th steps omitted.
PERCUSSION INSTRUMENTS. Those which are sounded by striking; drums, cymbals, bells, etc.
PHRASE. A musical statement, comparable to a line of poetry.

PHRYGIAN. One of the Greek scales.

PIANO. Soft, its symbol is *p.*

PITCH. That quality of a tone which is governed by the number of vibrations, and which we speak of as high or low.

PIU (*pyōō*). More.

PIZZICATO (*pĕt-sĕ-kä'tō*). The strings of any of the violin family of instruments to be plucked with the finger instead of bowed.

PLAIN SONG. A chant, without rhythm, in one of the ecclesiastical modes.

POCO (*pō'cō*). A little.

POLKA. A dance which originated in Bohemia about 1830, quite lively, in duple rhythm. (2–4 time.)

POLONAISE. A dignified, stately Polish dance in triple rhythm.

POLYPHONY. A style of composition in which several independent melodies move along simultaneously, but in harmony with each other.

PRESTO (*prĕs'tō*). Very rapid.

PROGRAM MUSIC. Music of a narrative or descriptive character, first applied to Beethoven's *Pastoral Symphony.*

QUARTET. A composition for four parts, either voices or instruments.

QUINTET. A composition for five parts.

RALLENTANDO (*räl-lĕn-tän'dō*). Gradually slower.

RECITATIVE (*rĕs-ĭ-tä-tēv'*). In a reciting style, declamatory.

REQUIEM. A mass for the dead.

RHAPSODY. A rhapsodical composition, irregular in form.

RHYTHM. As an element in music the term means pulsations or beats grouped by means of accent.

RITARDANDO (*rē-tär-dän'dō*). Gradually slower.

RITENUTO (*rē-tē-nōō'tō*). Immediately slower.

RONDO. A composition, either vocal or instrumental, in which the principal melody recurs after each of the other themes.

SCALE. The ladder of tones, in which the tones ascend by regular intervals, also usually descending in the same manner.

SCHERZO (*skĕr'tsō*). A composition in a joking, humorous style.

SECULAR MUSIC. Music intended for concert or theater, as opposed to sacred music intended for the church.

SENZA (*sĕn'tsä*). Without, as *senza pedale,* without pedal.

SFORZANDO (*sfôr-tsän'dō*). A sudden accent upon a given note or chord, the symbol being *sf.*

SLUR. The curved line drawn over a group of notes to indicate that they are to be connected smoothly.

SMORZANDO (*smôr-tsän'dō*). Dying away.

SOLFEGGIO. That singing manner in which the syllables, *do, re, mi, fa, sol, la, ti* are applied to the tones of the scale. The term is now used to include the singing of exercises upon a single vowel.

SONATA (*sō-nä'tä*). The most important musical form, composed of three or four movements, in different keys and moods, each also being in a different form, although this depends somewhat upon the content of the composition.

SOPRANO. The highest female, or boy's voice.

SORDINO (*sôr-dē'nō*). See mute.

SOSTENUTO (*sōs-tĕ-nōō'tō*). Sustained.

STACCATO (*stäk-kä'tō*). Detached, separated.

STREPITOSO (*strĕp-ĭ-tō'sō*). Impetuously.

STRINGENDO (*strĭn-jĕn'dō*). Running together, sudden acceleration.

SYMPHONIC POEM. A large instrumental form, invented by Liszt, having a program as its basis, and being all in one continuous movement.

SYMPHONY. A large composition for orchestra in the sonata form. It contains three or four movements. See *Sonata.*

TEMPO (*tĕm'pō*). The rate of speed at which a composition is to be performed.

TENOR. The high male voice. The term also refers to instruments in the range of the tenor voice.

TENUTO (*tā-nōō'tō*). To hold, sustain.

THEME. The melodic subject from which a composition is developed.

TIE. Curved line connecting two or more notes to indicate that they are to be added together, that is, to be performed as one note of their combined values.

TOCCATA (*tŏk-kä'tä*). A composition for organ, free in style, usually designed for the display of technical skill.

TRANQUILLO (*träŋ-kwĕl'lō*). Calm.

TREMOLO. A trembling or quivering effect, produced by a very rapid reiteration of a note.

TRIAD. The name of a chord of three tones.

TRIO. A composition for three voices or instruments. The second part of a march or minuet.

TRIPLET. A group of three tones played in the time of two of like value.

TUTTI (*tōō'tē*). All.

VARIATIONS. Elaborations of a given musical theme, produced by varying time, melody, harmony and key.

VELOCE (*vā-lō'chā*). With great velocity, swiftly.

VIGOROSO (*vē-gō-rō'sō*). Vigorous.

VIRTUOSO. A master of an instrument or of vocal technic. A very skillful performer.

VIVACE (*vē-vä'chā*). Vivaciously, lively.

VOLUME. The degree of tone strength, loudness, fullness.

WALTZ. A dance in triple time, performed by couples whirling around in rhythm with the music.

ZINGARESCA (*tsĭn-gä-räs'kä*). In the style of gypsy music.

SOME FAMOUS HYMNS AND THEIR TUNES

ABIDE WITH ME. Written by Rev. Henry Francis Lyte (1793–1847) and handed in manuscript with the music to his congregation at Lower Brixham, Devonshire, on the occasion of his last service there. Henry Ward Beecher introduced it to American Congregationalists in 1855. The tune now most used was written by Dr. William Henry Monk in 1861.

ALL GLORY, LAUD, AND HONOR. Composed in 820 by Theodulph, Bishop of Orleans, while imprisoned in the cloister of Anjou by Louis le Debonnaire, son of Charlemagne. Used as a processional in both Catholic and Protestant churches. Translated by Rev. J. M. Neale (1818–1866). The most popular tune was composed by Melchior Teschner, a Prussian composer who lived about 1613.

ALL HAIL THE POWER OF JESUS' NAME. Written by Rev. Edward Perronet (1721–1792), a close friend of John Wesley. Dr. Rippon added the last stanza. The tune "Old Coronation" was composed by Oliver Holden, a carpenter of Shirley, Mass. (1765–1844). The little pipe organ upon which he struck the first notes is in the historical rooms of the Old State House in Boston.

ALL PRAISE TO THEE, ETERNAL LORD. Variously credited to Gregory the Great (sixth century) and to an unknown writer of the ninth century. The German form—Gelobet seist du Jesu Christ—has been credited in part to Luther. The tune "Weimar" is by Karl Philip Emanuel Bach, son of Sebastian (1714–1788).

A MIGHTY FORTRESS IS OUR GOD or **EIN FESTE BURG IST UNSER GOTT.** Written in German by Luther (1483–1546); translated into English by Rev. Frederick Henry Hedge (1805–1890), formerly of the Unitarian Church of Bangor, Me. The tune was composed by Luther; that of the English version is by Sebastian Bach.

DOXOLOGIES. (1) "Be Thou, O God, Exalted High" is attributed to Nahum Tate (1652–1715), who collaborated with Rev. Nicholas Brady (1659–1726) in the preparation of a psalter in which it appeared. (2) "Praise God from Whom All Blessings Flow," by Rev. Thomas Ken (1637–1711). (3) "To God the Father, God the Son" was composed probably by Dr. Edwin F. Hatfield (1807–1883). The tune of these is "Old Hundred," said to have been composed by Luther; others say Louis Bourgeois; but the weight of evidence favors Guillaume le Franc, William Franck, or William the Frenchman of Geneva (1541), who died in 1570.

ETERNAL FATHER, STRONG TO SAVE. Written in 1860 by William Whiting; a translation of a Latin hymn. Whiting (1825–1878) was master of Winchester College choir. The tune "Melita" was composed in 1861 by Rev. John B. Dykes. A favorite hymn "for those at sea."

FOREVER WITH THE LORD. Written by James Montgomery (1771–1854). The tunes "Mornington," by Garrett Colley Wellesley, Earl of Mornington (1735–1781), and "Forever with the Lord," by I. B. Woodbury, are the best known of the many to which this hymn has been sung.

FROM GREENLAND'S ICY MOUNTAINS. Written in 1819 by Reginald Heber for a missionary meeting. The tune is by Lowell Mason.

GLORY TO THEE, MY GOD, THIS NIGHT, or **TALLIS' EVENING HYMN.** Bishop Ken's evening hymn prayer, from a *Prayer Manual* published for the use of students in Winchester College. The tune was composed by Thomas Tallis, organist to Queen Elizabeth (1520–1585).

HARK! HARK! MY SOUL. Written by Frederick William Faber. The tunes were composed by John B. Dykes and Henry Smart.

HOLY, HOLY, HOLY, LORD GOD ALMIGHTY. Written by the Right Reverend Reginald Heber, Bishop of Calcutta (1783–1826). The tune was composed by Rev. John Bacchus Dykes (1823–1876).

JERUSALEM THE GOLDEN. A translation by Dr. John Mason Neale of a part of Bernard of Cluny's "De Contemptu Mundi," which was written about 1100. The music was written by Alexander Ewing, a paymaster in the English army (1830–1895).

JESUS, LOVER OF MY SOUL. The best known and best loved of Charles Wesley's hymns. The tune "Refuge" was composed by Joseph P. Holbrook, and "Whitman" by Lowell Mason.

LEAD, KINDLY LIGHT. Written by John Henry Newman (1801–1890), afterwards Cardinal Newman. The tune "Lux Benigna" was composed by Rev. Dr. John B. Dykes in 1865.

MAGNIFICAT. Appears in ritual form in the liturgies of the fourth and fifth centuries. A favorite subject with composers of all nations and ages; but the "Magnificat" of Handel is the greatest (1685–1759); though that by Smart is highly esteemed.

MAJESTIC SWEETNESS SITS ENTHRONED. Written by Rev. Samuel Bennett, an English Baptist minister (1727–1795). The tune "Ortonville" was composed by Thomas Hastings (in 1830), author of "Toplady."

NEARER, MY GOD, TO THEE. Written by Mrs. Sarah Flower Adams (1805–1848) in 1840. The author was a Unitarian and the hymn is regarded as an Old Testament psalm. The tune "Horbury" was composed by Rev. John B. Dykes, "St. Edmund" by Sir Arthur Sullivan, and "Bethany" by Lowell Mason.

O COME, ALL YE FAITHFUL, or **ADESTE FIDELES.** By some believed to have been written by St. Bonaventure, Bishop of Albano, born (1221). The English version is by Rev. Frederick Oakely (1808–1880), and another by Rev. Edward Caswall (1814–1878). The tune is the "Portuguese Hymn," by Simao Portogallo of Lisbon (1763–1830).

O LITTLE TOWN OF BETHLEHEM. Written by Phillips Brooks, Bishop of Massachusetts (1835–1893), in 1868. The tune "Bethlehem" was composed by J. Barnby; the first tune, "St. Louis," was by Mr. Redner, organist of Holy Trinity in Philadelphia.

ONWARD, CHRISTIAN SOLDIERS. Written by Rev. Sabine Baring-Gould (1834–1906). The tune was composed by Sir Arthur Seymour Sullivan (1842–1900).

O WORSHIP THE KING ALL GLORIOUS ABOVE. Written by Sir Robert Grant (1785–1838), afterward governor of Bombay. The tune to which the hymn is most frequently sung is Haydn's "Lyons."

ROCK OF AGES, CLEFT FOR ME. Written by Augustus Montagu Toplady (1740–1778); an almost universal hymn. The tune was composed by Dr. Thomas Hastings (1784–1872) in 1830.

SUN OF MY SOUL, MY SAVIOUR DEAR. Written by Rev. John Keble (1792–1866). The tune "Hursley" was arranged by William Henry Monk (born 1823) from a German choral by Peter Ritter (1760–1846).

TE DEUM LAUDAMUS. Composed by Ambrose, Bishop of Milan, in 387. First sung in English by Bishop Ridley at Hearne Church. The standard anthem of Christian praise. One of the best modern choral renderings of the anthem is the tune by the English composer, Henry Smart (1813–1879).

THE GOD OF ABRAHAM PRAISE. Written by Thomas Olivers (1725–1799), a Welshman converted by Whitefield at Bristol. The tune "Leoni" was heard, it is said, by Olivers as it was sung by Meyer Lyon, the noted Jewish musician, and he adapted the hymn to the tune.

THE LORD DESCENDED FROM ABOVE. Composed by Thomas Sterhold, Groom of the Robes to Henry VIII. and Edward VI., author of a psalter published in 1562, 13 years after his death (1549). The tune "Nottingham," or "St. Magnus," was composed by Jeremiah Clark of London (1670–1707).

LIST OF FAMOUS OPERAS AND ORATORIOS

	Operas.
Adam (1803-56)	Chalet (1834), Postillon von Lonjumeau (1836) Cagliostro (1844).
Auber (*ō'bâr'*) (1782-1871)	Fra Diavolo, Massaniello (1828), Manon Lescaut (1856).
Balfe (*băl'f*) (1808-1870)	The Bohemian Girl (1843), Falstaff (1838)
Beethoven, (*bā'tō-vĕn*) (1770-1827)	Fidelio (1805).
Bellini (*bĕl-lē'nē*) (1801-35)	La Sonnambula (1831), Norma (1831), I Puritani (1834).
Berlioz (*bĕr'lē-ôz'*) (1803-69)	Benvenuto Cellini (1837), Béatrice and Bénédic (1862), The Trojans (1858, 1863).
Bizet (*bē-zĕ'*) (1838-1875)	Carmen (1875).
Boïto (*bō'ē-tō*) (1842-1919)	Mefistofele (1868).
Borodin (*bô-rô-dĭn'*) (1837-87)	Prince Igor (1891).
Charpentier (*shà-pän-tyā'*) (1860-)	Louise (1900), Julien (1914).
Cherubini (*kā-rōō-bē'nē*) (1760-1842)	Anacreon (1803), Médée (1797), Les Deux Journées (1800).
Cornelius (*kôr-nā'lē-ōōs*) (1824-74)	Barber of Bagdad (1858).
Dargomijsky (*dăr-gō-mēzh'skĭ*) (1813-1869)	The Stone Guest (1872), Esmeralda (1847).
d'Albert (*dal'bâr*) (1864-1932)	Tiefland (1903).
Debussy (*dē-bü-sē'*) (1862-1918)	Pelléas et Mélisande (1902).
Delibes (*dē-lēb'*) (1836-91)	Lakmé (1883).
d'Indy (*dăn-dē'*) (1851-1931)	Fervaal (1897).
Donizetti (*dō-nē-dzĕt'-tē*) (1798-1848)	Lucrezia Borgia (1833), Lucia di Lammermoor (1835), Elisire d'Amore (1837), Don Pasquale (1843), Daughter of the Regiment (1840).
Flotow (*flō'tō*) (1812-83)	Martha (1847).
Giordano (*jôr-dä'nō*) (1867-)	Andrea Chenier (1896), Fedora (1898).
Glinka (*glĭng'kä*) (1803-57)	A Life for the Czar (1836).
Gluck (*glŏŏk*) (1714-1787)	Alceste (1767), Orpheus and Euredice (1764), Armida (1777), Iphigénie en Aulide (1774), Iphigénie en Tauride (1779).
Goetz (*gŏts*) (1840-76)	Taming of the Shrew (1874).
Goldmark (*gôlt'märk*) (1832–1915)	The Queen of Sheba (1875), Merlin (1888), The Cricket on the Hearth (1896).
Gounod (*gōō-nō'*) (1818-93)	Faust (1859), The Queen of Sheba (1862), Romeo and Juliette (1869).
Granados (*grä-nä-dōz'*) (1867-1916)	Coyescas (1916).
Halévy (*hà-lā-vē'*) (1799-1862)	The Jewess (1835), L'Eclair (1835).

Suppé (*süp-pā'*) (1820-95)	Fatinitza (1876), Boccaccio (1879).
Thomas, Ambrose (*tô-mà'*) (1811-95)	Mignon (1866), Francesca da Rimini (1882).
Tschaikowsky (*chī-kôf'skē*) (1840-93)	Eugene Onegin (1879), Pique Dame (1890), Iolanthe (1893).
Verdi (*vâr'dē*) (1813-1901)	Ernani (1844), Rigoletto (1851), Il Trovatore (1853), La Traviata (1853), The Masked Ball (1859), Aïda (1871), Otello (1887), Falstaff (1893).

Operas—*Cont.*

Wagner, Richard (*väg'nĕr*) (1813-83)	Rienzi (1842), The Flying Dutchman (1844), Tannhäuser (1845). Lohengrin (1850), The Ring of the Nibelungs (1876), Meistersinger von Nürnberg (1868), Parsifal (1882).
Wagner, Siegfried (1869-)	Der Bärenhäuter (1899).
Weber (*vā'bĕr*) (1786-1826)	Der Freischütz (1821), Euryanthe (1823), Oberon (1826).
Wolf-Ferrari (*vôlf-fĕr-rä'rē*) (1876-)	The Secret of Susanne (1909), Jewels of the Madonna (1911).

Oratorios.

Bach (*bäk*) (1685-1750)	Christmas Oratorio (1764), St. Matthew Passion (1729), St. John Passion (1720).
Barnett (1836-1916)	The Raising of Lazarus (1876).
Beethoven (1770-1827)	The Mount of Olives (1799).
Berlioz (1803-69)	L'Enfance du Christ (1854).
Brahms (*bräms*) (1833-97)	The German Requiem (1868).
Bruch (*brŏŏk*) (1838-1920)	Odysseus, Lied von der Glocke, Normannenzug.
Carissimi (*kä-rĭs'sĭ-mē*) (1604?-74)	Jephte, Baltazar.
Cavalieri (*vä-vä-lyâ'-rē*) (1550?-99?)	The Representation of the Spirit and the Body (the first oratorio, 1600).
Cimarosa (*chē-mä-rō'zä*) (1749-1801)	Il Sacrificio d'Abramo (1786).
Cowen (1852-)	The Deluge (1878), Ruth (1887).
David, F. C. (*dȧ-vēd'*) (1810-76)	Moïse au Sinai (1846).
Dubois (*dŭ-bwä'*) F. C. T. (1837-1924)	The Seven Last Words of Christ (1867).
Dvořák (*dvôr'zhäk*) (1841-1904)	Stabat Mater (1883), St. Ludmila (1886), Requiem Mass (1890).
Elgar (1857-1934)	The Light of Life (1896), Caractacus (1898), The Dream of Gerontius (1900).
Franck (*fränk*) (1822-90)	The Beatitudes, Ruth (1846), The Rédemption (1873).
Goldschmidt, O. (*gôlt'shmĭt*)	Ruth (1867).
Gounod (1818-93)	The Redemption (1882), Mors et Vita (1885), Messe Solonelle (1850).
Graun (*groun*) (1701-59)	The Death of Jesus (1755).

Oratorios—*Cont.*

Handel (*hăn'dĕl*) (1685-1759)	Israel in Egypt (1738), Esther (1720), Saul (1738), The Messiah (1742), Samson (1744), Joseph (1743), Judas Maccabaeus (1747).
Haydn (*hā'd'n*) (1732-1809)	The Creation (1799), The Seasons (1801).
Hiller, F. (1811-85)	Die Zerstörung Jerusalems (1840), Saul (1858).
Kiel, F. (*kēl*) (1821-85)	Christus (1874).
Liszt (*lĭst*) (1811-86)	Die Legende von der Heiligen Elisabeth (1864), Christus (1866).
Loewe (*lō-vĕ'*) (1796-1869)	Die Zerstörung Jerusalems (1829).
Macferren (1813-87)	St. John the Baptist (1873).
Mackenzie (1847-)	The Rose of Sharon (1884).
Mendelssohn (1809-47)	St. Paul (1836), Hymn of Praise (1840), Elijah (1838-46).
Parker (1863-1919)	Hora Novissima (1893).
Parry, C. H. (1848-1918)	Judith (1888), Job (1892), King Saul (1894).
Pergolesi (1710-36)	San Guglielmo d'Aquitania (1731).
Pierné (*pĭ-ĕr'nā*) (1863-)	The Children's Crusade (1905).
Porpora (*pôr'pō-rȧ*) (1686-1767)	La Martiria di Sante Eugenia.
Rossini (1792-1868)	Stabat Mater (1832–41).
Rubinstein (1829-94)	The Tower of Babel (1870), The Lost Paradise (1858), Moses (1887), Christus (1895).
Saint-Saëns (1835-1921)	Noël (1858).
Scarlatti, A. (1659-1725)	Dolori di Maria, Sacrificio d'Abramo.
Schubert (1797-1828)	Lazarus (1828).
Schumann (*shōō'-män*) (1810-56)	Paradise and the Peri (1843). Resurrection, Passion, The Seven Last Words of Christ.
Schütz (*shütz*)	
Spohr (1784-1859)	Last Judgment (1812), Calvary (1833), Fall of Babylon (1842).
Stainer (1840-1901)	St. Mary Magdalen (1883), The Crucifixion (1887).
Stanford (1852-1924)	The Resurrection (1875), The Three Holy Children (1885).
Sullivan (1842-1900)	The Prodigal Son (1869), The Light of the World (1873).
Verdi (1813-1901)	Manzoni Requiem (1874).
Zingarelli (*tsĭn-gȧ-rĕ'lĭ*) (1752-1837)	The Flight into Egypt (1837).

SPECIAL INDEX

The following special indexes of the *New Century Book of Facts* have been compiled with the single idea of making this work the most used single-volume reference book obtainable. It is a feature which is found in but few books. The four distinct divisions are: Dictionaries, Illustrations, Outlines, and Tables or Tabulations.

Dictionaries—An index dealing with the 129 special dictionaries in the work. These range in length from 95 pages as found in the Dictionary of History, down to a single page as in the Dictionary of Journalistic Terms.

Illustrations—The *New Century Book of Facts* is so well illustrated that we have had hundreds of suggestions from satisfied purchasers that we could make the illustrations more vital to the home, to the child, more practical to the user if they were listed. Hence, you will find all of the major illustrations listed in that part of the special index. While most of the illustrations are inserts without page numbers, still the page mentioned in the index after the item represents the page opposite which will be found the particular illustration.

Outline—Teachers find that one of the best tests of a child's knowledge of a subject is to have him outline that subject. The business man or the average reader does not in these times care to take hours to ascertain a few facts. To illustrate: If one desires the salient facts about any president (1150 et seq.), instead of reading through numerous pages these facts are given in outline form and by reason of elimination of all padding, ascertained in a few moments. Further, it is only by such outlines that *comparative* study of history and literature, as found on pages 174 and 866 respectively, can be made. Only single volumes such as this permit of such outlines, hence their especial value.

Tables or Tabulations—These are of value to the individual desirous of getting quick, concise information. There are over 350 tables or tabulations throughout the work. It is worth noting that these tables are largely all hand set matter. The student or parent, for example, desiring information on the *bean* not only finds all the different kinds of beans grouped together, but in a few moments' reading across the page, gains all the necessary facts relative to it, saving hours of reading and, what is more important, by its very accessibility, unconsciously fostering the vital habit of research.

Considering the size of the *New Century Book of Facts*, there is no other work on the market today so thoroughly indexed. Due to the number of books that are being placed on the market each successive year and in the case of large sets where special index volumes are used, making it necessary to use *two volumes* to get one fact, the single volume is the most practical reference obtainable. These special indexes are here used for the first time as a result of insistent demand from users of the *New Century Book of Facts*. Their worth-whileness has already been proved by this demand.
